SNS COLLEGE OF ENGINEERING

Kurumbapalayam (Po), Coimbatore – 641 107

An Autonomous Institution

Accredited by NBA – AICTE and Accredited by NAAC – UGC with 'A' Grade
Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

DEPARTMENT OF COMPUTER SCIENCE AND DESIGN

COURSE NAME : 19CS302 AGILE SOFTWARE ENGINEERING

II YEAR /III SEMESTER

Unit 1- Introduction to Software Engineering

Topic 1: The Nature of Software -Software Engineering

Brain Storming

1. What is Software?
2. How to develop software?

The Nature of Software

Software is intangible

- Hard to understand development effort

Software is easy to reproduce

- Cost is in its *development*
  - in other engineering products, manufacturing is the costly stage

The industry is labor-intensive

- Hard to automate

The Nature of Software

Untrained people can hack something together

– Quality problems are hard to notice

Software is easy to modify

– People make changes without fully understanding it

Software does not ‘wear out’

– It *deteriorates* by having its design changed:

- erroneously, or
- in ways that were not anticipated, thus making it complex

Types of Software...

Custom
- For a specific customer

Generic
- Sold on open market
- Often called
  - COTS (Commercial Off The Shelf)
  - Shrink-wrapped

Embedded
- Built into hardware
- Hard to change

Types of Software

Real time software
- E.g. control and monitoring systems
- Must react immediately
- Safety often a concern

Data processing software
- Used to run businesses
- Accuracy and security of data are key

Some software has both aspects

What is Software Engineering?...

The process of solving customers' problems by the systematic development and evolution of large, high-quality software systems within cost, time and other constraints

Other definitions:

- IEEE: (1) the application of a systematic, disciplined, quantifiable approach to the development, operation, maintenance of software; that is, the application of engineering to software. (2) The study of approaches as in (1).
- The Canadian Standards Association: The systematic activities involved in the design, implementation and testing of software to optimize its production and support.

What is Software Engineering?...

Solving customers' problems

- This is the *goal* of software engineering
- Sometimes the solution is to *buy, not build*
- Adding unnecessary features does not help solve the problem
- Software engineers must *communicate effectively* to identify and understand the problem

What is Software Engineering?...

Systematic development and evolution

- An engineering process involves applying *well understood techniques* in a organized and *disciplined* way
- Many well-accepted practices have been formally standardized
  - e.g. by the IEEE or ISO
- Most development work is *evolution*

What is Software Engineering?...

Large, high quality software systems

- Software engineering techniques are needed because large systems *cannot be completely understood* by one person
- Teamwork and co-ordination are required
- Key challenge: Dividing up the work and ensuring that the parts of the system work properly together
- The end-product must be of sufficient quality

What is Software Engineering?

Cost, time and other constraints

- Finite resources
- The benefit must outweigh the cost
- Others are competing to do the job cheaper and faster
- Inaccurate estimates of cost and time have caused many project failures

Software Engineering and the Engineering Profession

The term Software Engineering was coined in 1968

- People began to realize that the principles of engineering should be applied to software development

Engineering is a licensed profession

- In order to protect the public
- Engineers design artifacts following well accepted practices which involve the application of science, mathematics and economics
- Ethical practice is also a key tenet of the profession

In many countries, much software engineering does not require an engineering licence, but is still engineering

Software Engineering and the Engineering Profession

Ethics in Software Engineering:

Software engineers shall

- Act consistently with public interest
- Act in the best interests of their clients
- Develop and maintain with the highest standards possible
- Maintain integrity and independence
- Promote an ethical approach in management
- Advance the integrity and reputation of the profession
- Be fair and supportive to colleagues
- Participate in lifelong learning

Stakeholders in Software Engineering

1. Users
   – Those who use the software
2. Customers
   – Those who pay for the software
3. Software developers
4. Development Managers

All four roles can be fulfilled by the same person

Software Quality...

Usability

- Users can learn it and fast and get their job done easily

Efficiency

- It doesn't waste resources such as CPU time and memory

Reliability

- It does what it is required to do without failing

Maintainability

- It can be easily changed

Reusability

- Its parts can be used in other projects, so reprogramming is not needed

Software Quality and the Stakeholders

Customer:
solves problems at
an acceptable cost in
terms of money paid and
resources used

User:
easy to learn;
efficient to use;
helps get work done

Developer:
easy to design;
easy to maintain;
easy to reuse its parts

Development manager:
sells more and
pleases customers
while costing less
to develop and maintain

Short Term Vs. Long Term Quality

Short term:

- Does the software *meet the customer's immediate needs*?
- Is it sufficiently efficient for the volume of data we have *today*?

Long term:

- Maintainability
- Customer's future needs
- Scalability: Can the software handle larger volumes of data?

Software Engineering Projects

Most projects are *evolutionary* or *maintenance* projects, involving work on *legacy* systems

- Corrective projects: fixing defects
- Adaptive projects: changing the system in response to changes in
  - Operating system
  - Database
  - Rules and regulations
- Enhancement projects: adding new features for users
- Reengineering or perfective projects: changing the system internally so it is more maintainable

Activities Common to Software Projects...

Requirements and specification

- Includes
  - Domain analysis
  - Defining the problem
  - Requirements gathering
    - Obtaining input from as many sources as possible
  - Requirements analysis
    - Organizing the information
  - Requirements specification
    - Writing detailed instructions about how the software should behave

Activities Common to Software Projects...

Design

- Deciding how the requirements should be implemented, using the available technology
- Includes:
  - *Systems engineering*: Deciding what should be in hardware and what in software
  - *Software architecture*: Dividing the system into subsystems and deciding how the subsystems will interact
  - *Detailed design* of the internals of a subsystem
  - *User interface design*
  - *Design of databases*

Activities Common to Software Projects

Modeling
- Creating representations of the domain or the software
  - Use case modeling
  - Structural modeling
  - Dynamic and behavioural modeling

Programming

Quality assurance
- Reviews and inspections
- Testing

Deployment

Managing the process

Difficulties and Risks in Software Engineering

- Complexity and large numbers of details
- Uncertainty about technology
- Uncertainty about requirements
- Uncertainty about software engineering skills
- Constant change
- Deterioration of software design
- Political risks

Assessment 1

1. What is Software Engineering?

Ans : _____

2. What are the salient features of Software Engineering?

Ans : _____
