DEPARTMENT OF ELECTRONICS AND COMMUNICATION ENGINEERING

- The BINARY to GRAY CODE CONVERTER is a digital circuit that is used to convert the binary input into the corresponding equivalent gray code at its output.
- The circuit is a simple digital circuit which employs the use of Ex-OR gate IC for its operation. The output of the circuit (Gray code) finds various practical applications

## WHAT IS A BINARY CODE ?

*A binary code represents text or computer processor instructions using the binary number system's two binary digits, 0 and 1. The binary code assigns a bit string to each symbol or instruction.*

DEPARTMENT OF ELECTRONICS AND COMMUNICATION ENGINEERING

## Binary-to-Gray code conversion

- i. The MSB in the Gray code is the same as corresponding MSB in the binary number.
- ii. Going from left to right, add each adjacent pair of binary code bits to get the next Gray code bit. Discard carries.

eg convert  $10110_2$  to Gray code
