SCHEDULES

- Schedule – a sequences of instructions that specify the chronological order in which instructions of concurrent transactions are executed
 - a schedule for a set of transactions must consist of all instructions of those transactions
 - must preserve the order in which the instructions appear in each individual transaction.

- **Serial Schedule**

It is a schedule in which transactions are aligned in such a way that one transaction is executed first. When the first transaction completes its cycle, then the next transaction is executed. Transactions are ordered one after the other. This type of schedule is called a serial schedule, as transactions are executed in a serial manner.

- **Schedule 1**

- Let T_1 transfer 50 from A to B , and T_2 transfer 10% of the balance from A to B .
- A serial schedule in which T_1 is followed by T_2 :

SCHEDULES

T_1	T_2
<pre>read(A) A := A - 50 write (A) read(B) B := B + 50 write(B)</pre>	<pre>read(A) temp := A * 0.1 A := A - temp write(A) read(B) B := B + temp write(B)</pre>

SCHEDULES

- **Schedule 2**

A serial schedule where T_2 is followed by T_1

- **Schedule 3**

- Let T_1 and T_2 be the transactions defined previously. The following schedule is not a serial schedule, but it is *equivalent* to Schedule 1.

- **Schedule 4**

The following concurrent schedule does not preserve the value of $(A + B)$.

SCHEDULES

T_1	T_2
<pre>read(A) A := A - 50 write(A) read(B) B := B + 50 write(B)</pre>	<pre>read(A) temp := A * 0.1 A := A - temp write(A) read(B) B := B + temp write(B)</pre>

T_1	T_2
<pre>read(A) A := A - 50 write(A) read(B) B := B + 50 write(B)</pre>	<pre>read(A) temp := A * 0.1 A := A - temp write(A) read(B) B := B + temp write(B)</pre>

T_1	T_2
<pre>read(A) A := A - 50 write(A) read(B) B := B + 50 write(B)</pre>	<pre>read(A) temp := A * 0.1 A := A - temp write(A) read(B) B := B + temp write(B)</pre>
