# DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING-IOT Including CS\&BCT 

COURSE NAME : 19CS307- DATA STRUCTURES

II YEAR / III SEMESTER

Unit V- SORTING AND SEARCHING
Topic :SELECTION SORT

## Selection sort

Selection sort is a simple sorting algorithm. This sorting algorithm is an in-place comparison-based algorithm in which the list is divided into two parts, the sorted part at the left end and the unsorted part at the right end. Initially, the sorted part is empty and the unsorted part is the entire list.
The smallest element is selected from the unsorted array and swapped with the leftmost element, and that element becomes a part of the sorted array.
This process continues moving unsorted array boundary by one element to the right. This algorithm is not suitable for large data sets as its average and worst case complexities are of $O\left(n^{2}\right)$, where $\mathbf{n}$ is the number of items.

## Selection Sort Working

Consider the following depicted array as an example.
143342710424

For the first position in the sorted list, the whole list is scanned sequentially. The first position where 14 is stored presently, we search the whole list and find that 10 is the lowest value.

| 14 | 33 | 27 | 10 | 35 | 19 | 42 | 44 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

So we replace 14 with 10 . After one iteration 10, which happens to be the minimum value in the list, appears in the first position of the sorted list.

## CONN.....

| 10 | 33 | 27 | 35 |
| :--- | :--- | :--- | :--- |

For the second position, where 33 is residing, we start scanning the rest of the list in a linear manner.

| 10 | 33 | 27 | 35 |
| :--- | :--- | :--- | :--- |

We find that 14 is the second lowest value in the list and it should appear at the second place. We swap these values.
$10 \quad 33$ 27 14 35 49

After two iterations, two least values are positioned at the beginning in a sorted manner.

## CONN..

| 10 | 14 | 27 | 33 | 35 | 19 | 42 | 44 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

The same process is applied to the rest of the items in the array. Following is a pictorial depiction of the entire sorting process -

LİST..

| 10 | 14 | 27 | 33 | 35 | 19 | 42 | 44 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 | 14 | 27 | 33 | 35 | 19 | 42 | 44 |
| 10 | 14 | 19 | 33 | 35 | 27 | 42 | 44 |
| 10 | 14 | 19 | 33 | 35 | 27 | 42 | 44 |
| 10 | 14 | 19 | 27 | 35 | 33 | 42 | 44 |
| 10 | 14 | 19 | 27 | 35 | 33 | 42 | 44 |
| 10 | 14 | 19 | 27 | 35 | 33 | 42 | 44 |
| 10 | 14 | 19 | 27 | 33 | 35 | 42 | 44 |
| 10 | 14 | 19 | 27 | 33 | 35 | 42 | 44 |

# Algorithm <br> Step 1 - Set MIN to location 0 <br> Step 2 - Search the minimum element in the list Step 3 - Swap with value at location MIN <br> Step 4 - Increment MIN to point to next element Step 5 - Repeat until list is sorted 

## CONN.

## procedure selection sort

list : array of items
n : size of list
for $\mathbf{i}=1$ to $\mathbf{n - 1}$
/* set current element as minimum*/ min = i
/* check the element to be minimum */

CONN.

$$
\begin{aligned}
& \text { for } \mathrm{j}=\mathrm{i}+1 \text { to } \mathrm{n} \\
& \text { if list }[j]<\text { list[min] then } \\
& \min =\mathrm{j} ; \\
& \text { end if } \\
& \text { end for }
\end{aligned}
$$

/* swap the minimum element with the current element*/
if indexMin != i then
swap list[min] and list[i]
end if
end for
end procedure

## CONN....

## THANK YOU
