

Definition

Fuel cell is a voltaic cell. It converts chemical energy of the fuels directly into electricity without combustion. In these cells, the reactants and electrolytes are continuously supplied to the cell.

Fuel + oxygen —	\longrightarrow	Oxidation products	+	Electricity

Examples:

Hydrogen - oxygen fuel cell.

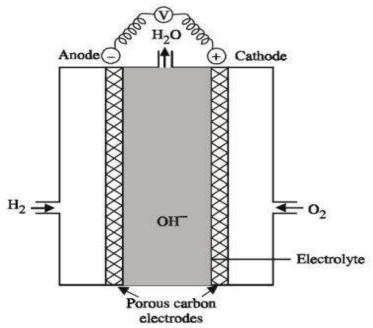

Fuel Cell

Hydrogen - oxygen fuel cell

It is the simplest and most successful fuel cell. The fuel-hydrogen and the oxidiser-oxygen and the liquid electrolyte are continuously supplied to the cell.

Fuel Cell

Description

- The cell has two porous electrodes, anode and cathode.
- The electrodes are made of compressed carbon containing a small amount of catalyst (Pt, Pd, Ag).
- Between the two electrodes an electrolytic solution, 25% KOH is filled.

Working

- Hydrogen passes through the anode compartment, where it is oxidized.
- Oxygen passes through the cathode compartment, where it is reduced.

Cell reactions

At anode:	$2H_2 + 4OH^- \longrightarrow 4H_2O + 4e^-$
At cathode:	$O_2 + 2H_2O + 4e \longrightarrow 4OH$
Overall cell reaction:	$2H_2 + O_2 \longrightarrow 2H_2O + Energy$

• The emf of the cell = 0.8 to 1.0V

Advantages of Fuel Cells

- 1. They are efficient and instant in operation.
- 2. They are pollution free.
- 3. They produce electric current directly from the reaction of a fuel and an oxidizer.
- 4. They are light in weight

Disadvantages

- 1. Fuel cells cannot store electric energy.
- 2. Electrodes are expensive and short lived.
- 3. H_2 should be pure.

Applications

1. $H_2 - O_2$ fuel cells are used in space crafts, submarines to get electricity 2. In $H_2 - O_2$ fuel cell, the product water is a valuable source of fresh water for astronauts
