

Lecture 6

PIC Programming in C

Code Space Limitations

- On a general purpose PC, we don't usually care about our program's size
- MB/GB/TB range for general purpose PCs
 - Ex: 1300 line .C file 50 KB → 40 KB .hex file
- 2MB max in PIC18's Program ROM
- **For our PIC18F452 → Only 32KB**
 - See datasheet

Why C over ASM?

- While Assembly Language produces a much smaller .HEX file than C...
 - More human-readable in C
 - Easier to write and less time consuming
 - C is easier to modify and update
 - Don't care about absolute ROM locations
 - Access to many C function libraries
 - C code is portable and can be used on other microcontrollers with little or no modification

C Integer Data Types (Generic)

Type	Explanation	Format Specifier
char	Smallest addressable unit of the machine that can contain basic character set. It is an integer type. Actual type can be either signed or unsigned depending on the implementation. It contains <code>CHAR_BIT</code> bits. ^[3]	%c
signed char	Of the same size as <code>char</code> , but guaranteed to be signed. Capable of containing at least the $[-127, +127]$ range. ^{[3][4]}	%c (or %hhi for numerical output)
unsigned char	Of the same size as <code>char</code> , but guaranteed to be unsigned. It is represented in binary notation without padding bits; thus, its range is exactly $[0, 2^{\text{CHAR_BIT}} - 1]$. ^[5]	%c (or %hhu for numerical output)
short short int signed short signed short int	<i>Short</i> signed integer type. Capable of containing at least the $[-32767, +32767]$ range, ^{[3][4]} thus, it is at least 16 bits in size. The negative value is -32767 (not -32768) due to the one's-complement and sign-magnitude representations allowed by the standard, though the two's-complement representation is much more common. ^[6]	%hi
unsigned short unsigned short int	Similar to <code>short</code> , but unsigned.	%hu
int signed signed int	Basic signed integer type. Capable of containing at least the $[-32767, +32767]$ range, ^{[3][4]} thus, it is at least 16 bits in size.	%i or %d
unsigned unsigned int	Similar to <code>int</code> , but unsigned.	%u
long long int signed long signed long int	<i>Long</i> signed integer type. Capable of containing at least the $[-2147483647, +2147483647]$ range, ^{[3][4]} thus, it is at least 32 bits in size.	%li
unsigned long unsigned long int	Similar to <code>long</code> , but unsigned.	%lu
long long long long int signed long long signed long long int	<i>Long long</i> signed integer type. Capable of containing at least the $[-9223372036854775807, +9223372036854775807]$ range, ^{[3][4]} thus, it is at least 64 bits in size. Specified since the C99 version of the standard.	%lli
unsigned long long unsigned long long int	Similar to <code>long long</code> , but unsigned. Specified since the C99 version of the standard.	%llu

C Integer Data Types (C18 Compiler)

TABLE 2-1: INTEGER DATA TYPE SIZES AND LIMITS

Type	Size	Minimum	Maximum
<code>char^(1,2)</code>	8 bits	-128	127
<code>signed char</code>	8 bits	-128	127
<code>unsigned char</code>	8 bits	0	255
<code>int</code>	16 bits	-32,768	32,767
<code>unsigned int</code>	16 bits	0	65,535
<code>short</code>	16 bits	-32,768	32,767
<code>unsigned short</code>	16 bits	0	65,535
<code>short long</code>	24 bits	-8,388,608	8,388,607
<code>unsigned short long</code>	24 bits	0	16,777,215
<code>long</code>	32 bits	-2,147,483,648	2,147,483,647
<code>unsigned long</code>	32 bits	0	4,294,967,295

C Integer Data Types (XC8 Compiler)

TABLE 5-1: INTEGER DATA TYPES

Type	Size (bits)	Arithmetic Type
bit	1	Unsigned integer
signed char	8	Signed integer
<u>unsigned char</u>	8	Unsigned integer
<u>signed short</u>	16	Signed integer
unsigned short	16	Unsigned integer
<u>signed int</u>	16	Signed integer
unsigned int	16	Unsigned integer
<u>signed short long</u>	24	Signed integer
unsigned short long	24	Unsigned integer
<u>signed long</u>	32	Signed integer
unsigned long	32	Unsigned integer
signed long long	32	Signed integer
unsigned long long	32	Unsigned integer

Unsigned char (0 to 255)

- PIC18 is 8-bit architecture, **char type** (8 bits) is the most natural choice
- C compilers use **signed char** (-128 to +127) by default unless we put “unsigned”
 - **char == signed char**

Write a C18 program to send values 00–FF to Port B.

Solution:

```
#include <P18F458.h>           //for TRISB and PORTB declarations
void main(void)
{
    unsigned char z;
    TRISB = 0;                 //make Port B an output
    for(z=0; z<=255; z++)
        PORTB = z;
    while(1);                 //NEEDED IF RUNNING IN HARDWARE
}
```

Unsigned char array (0 to 255)

Write a C18 program to send hex values for ASCII characters of 0, 1, 2, 3, 4, 5, A, B, C, and D to Port B.

Solution:

```
#include <P18F458.h>
void main(void)
{
    unsigned char mynum[] = "012345ABCD"; //data is stored in RAM
    unsigned char z;
    TRISB = 0; //make Port B an output
    for(z=0; z<10; z++)
        PORTB = mynum[z];
    while(1); //stay here forever
}
```

Hex	Dec	Char	Hex	Dec	Char
0x20	32	Space	0x40	64	@
0x21	33	!	0x41	65	A
0x22	34	"	0x42	66	B

0x3E	62	>	0x5E	94	^
0x3F	63	?	0x5F	95	_

Unsigned char array (0 to 255)

```
1 #include <xc.h> //PIC18F452
2
3 // This program sends numeric values (hex/dec/bin)
4 // for the ASCII characters of 0-5, A-D to PORTB
5
6 void main(void)
7 {
8     unsigned char myNum[] = "012345ABCD"; //data stored in RAM
9     unsigned char z;
10
11     TRISB = 0; //PORTB is an OUTPUT on all pins
12
13     for (z=0; z<10; z++)
14     {
15         PORTB = myNum[z]; //write ASCII char to PORTB
16     }
17 }
```

Unsigned char array (0 to 255)

```
1 #include <xc.h> //PIC18F452
2
3 // This program sends numeric values (hex/dec/bin)
4 // for the ASCII characters of 0-5, A-D to PORTB
5
6 void main(void)
7 {
8     unsigned char myNum[] = "012345ABCD"; //data stored
9     unsigned char z;
10
11     TRISB = 0; //PORTB is an OUTPUT on all pins
12
13     for(z=0; z<10; z++)
14     {
15         PORTB = myNum[z]; //write ASCII char to PORTB
16     }
17 }
```

0x37	55	7	0x57	87	W

z = 6

PORTB = 'A' (in code)

PORTB = 0x41 = 65 (actual)

PORTB = 0b 0100 0001 (pins)

Signed char (-128 to +127)

- Still 8-bit data type but MSB is sign value

Write a C18 program to send values of -4 to +4 to Port B.

Solution:

```
//sign numbers
#include <P18F458.h>
void main(void)
{
    char mynum[] = {+1, -1, +2, -2, +3, -3, +4, -4};
    unsigned char z;
    TRISB = 0; //make Port B an output
    for(z=0; z<8; z++)
        PORTB = mynum[z];
    while(1); //stay here forever
}
```

Unsigned int (0 to 65,535)

- PIC18 is 8-bit architecture, **int type** (16 bits) takes two bytes of RAM (only use when necessary)
- C compilers use **signed int** (-32,768 to +32,767) by default unless we put “unsigned”
 - **int == signed int**

```
#include <P18F458.h>
void main(void)
{
    unsigned int z;
    TRISB = 0;           //make Port B an output
    for(z=0; z<=50000; z++)
    {
        PORTB = 0x55;
        PORTB = 0xAA;
    }
    while(1);           //stay here forever
}
```

Larger Integer Types (short, long, short long)

Write a C18 program to toggle all bits of Port B 100,000 times.

Solution:

```
//toggle PB 100,00 times
#include <P18F458.h>
void main(void)
{
    unsigned short long z;
    unsigned int x;
    TRISB = 0; //make Port B an output
    for(z=0;z<=100000;z++)
    {
        PORTB = 0x55;
        PORTB = 0xAA;
    }
    while(1); //stay here forever
}
```

Floating-Point Data Types

- Can store and calculate numbers with decimals (precision)
- Always **signed**, can't be **unsigned**
2.5, 32.05898, -1.00232, .2600313, 51156.01, etc.

TABLE 5-3: FLOATING-POINT DATA TYPES

Type	Size (bits)	Arithmetic Type
float	24 or 32	Real
double	24 or 32	Real
long double	same as double	Real

- Further info: [Text](#) and [Video Explanation](#)

Modulus

- In C can use `%` to perform a modulus of two numbers (find the whole number remainder from a “repeated subtraction”)
- $25 \% 5 = 0$
- $25 \% 7 = 4$
- $25 \% 10 = 5$
- $428 \% 100 = 28$
- $1568 \% 10 = 8$

Casting to Prevent Data Loss

```
int i = 7;
int j = 2;
int k = 0;
float f;

//through variables
k = i / j;           // k =
f = i / j;           // f =
f = (float)i / j;   // f =

//direct numbers/literals
k = 7 / 2;           // k =
f = 7 / 2;           // f =
f = 7.0 / 2;         // f =
```

?

?

Casting to Prevent Data Loss

Time Delay

- Want to prevent data loss

```
int i = 7;  
int j = 2;  
int k = 0;  
float f;
```

```
//through variables
```

- Three methods:
 - Using `int`
 - Using `float`
 - Built-in `float`

```
k = i / j;           // k = 3  
f = i / j;           // f = 3.0  
f = (float)i / j;    // f = 3.5
```

```
//direct numbers/literals
```

```
k = 7 / 2;           // k = 3  
f = 7 / 2;           // f = 3.0  
f = 7.0 / 2;         // f = 3.5
```

(accurate)

Two Factors for Delay Accuracy in C

- 1. The crystal's frequency (int. or ext.)**
 - Duration of clock period for instruction cycle
- 2. The compiler used for the C program**
 - In ASM, we control the exact instructions
 - Different compilers produce different ASM code

Time Delay Example

Write a C18 program to toggle all the bits of Port B ports continuously with a 250 ms delay. Assume that the system is PIC18F458 with XTAL = 10 MHz.

```
#include <PIC18F452.h>
void MS_Delay(unsigned int);

void main(void)
{
    TRISB = 0;
    while(1)
    {
        PORTB = 0x55;
        MS_Delay(250);
        PORTB = 0xAA;
        MS_Delay(250);
    }
}

void MS_Delay(unsigned int msTime)
{
    unsigned int i;
    unsigned int j;

    for(i=0; i<msTime; i++)
        for(j=0; j<2500; j++)
            //NOP
}
```

$$F_{\text{OSC}} = 10 \text{ MHz} = 10,000,000 \text{ cycles/sec}$$

Each instruction takes 4 clock cycles (ticks)

$$F_{\text{CY}} = \frac{\text{Instruction Cycle Frequency}}{4} = \frac{10\text{MHMM}}{4} = 2.5\text{MHz} = 2,500,000 \text{ Ins/sec}$$

$$T_{\text{CY}} = \text{Instruction Cycle Time} \\ = 1 / 2.5\text{MHz} = 0.0000004 \text{ sec per Ins} \\ = 0.0004 \text{ ms} = 0.4 \mu\text{s}$$

How many IC (instructions) fit into 1ms?

$$1\text{ms} / 0.0004\text{ms} = 2,500$$

- 2,500 Instruction Cycles take place in 1ms
- 2,500 Instructions can complete in 1ms²³

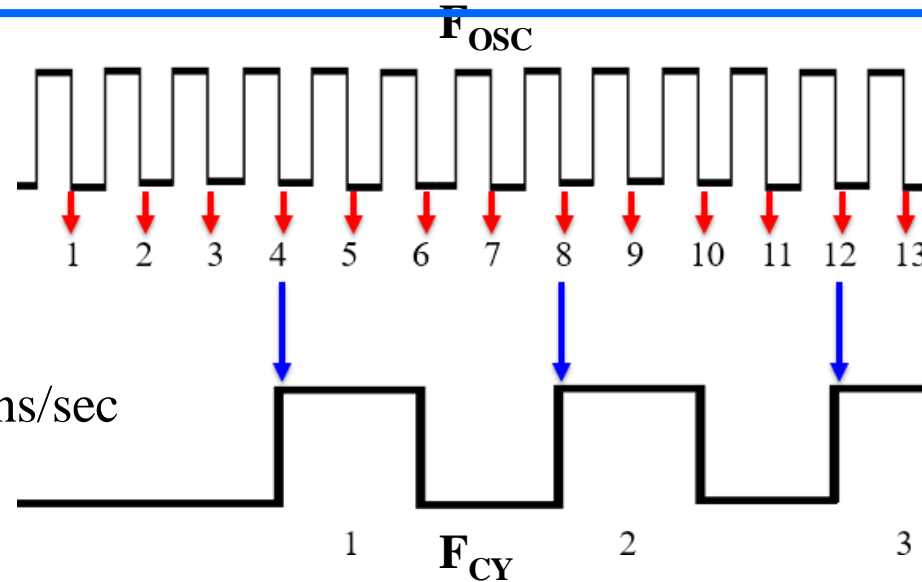

Instruction Cycle

$$\begin{aligned} F_{\text{OSC}} &= \text{Oscillator Frequency} \\ &= 10 \text{ MHz} = 10,000,000 \text{ cycles/sec} \end{aligned}$$

Each instruction takes 4 clock cycles (ticks)

$$\begin{aligned} F_{\text{CY}} &= \text{Instruction Cycle Frequency} \\ &= \frac{F_{\text{OSC}}}{4} = \frac{10\text{MHz}}{4} = 2.5\text{MHz} = 2,500,000 \text{ Ins/sec} \end{aligned}$$

$$\begin{aligned} T_{\text{CY}} &= \text{Instruction Cycle Time} \\ &= \frac{1}{F_{\text{CY}}} = \frac{1}{2.5\text{MHz}} = 0.0000004 \text{ sec per Ins} \\ &= 0.0004 \text{ ms} = 0.4 \mu\text{s} \end{aligned}$$

How many IC (instructions) fit into 1ms?

$$1\text{ms} / 0.0004\text{ms} = 2,500$$

→ 2,500 Instruction Cycles take place in 1ms

24

→ 2,500 Instructions can complete in 1ms (generalizing since most instructions only take 1 Ins. Cycle)

Delay Functions in the XC8 Compiler

1. Include the “**xc.h**” header file
2. Define your crystal’s frequency
 - **_XTAL_FREQ**
3. Can now use these 2 delay functions:
 - **__delay_us(x);** //unsigned long (0 - 4294967295)
 - **__delay_ms(x);** //unsigned long (0 - 4294967295)

```
1 #include <xc.h>
2
3 #define _XTAL_FREQ 10000000 // Running at 10MHz
4
5 #define LED_LEFT PORTAbits.RA3 // QwikFlash red LED (left) to toggle
6 #define LED_CENTER PORTAbits.RA2 // QwikFlash red LED (center) to toggle
7 #define LED_RIGHT PORTAbits.RA1 // QwikFlash red LED (right) to toggle
8
9 void Toggle_LEDs(void);
10
11 void main(void)
12 {
13     TRISA = 0; //PORTA is an OUTPUT
14
15     //Main routine
16     while(1)
17     {
18         //Your main code goes here
19         Toggle_LEDs();
20     }
21 }
22
23 void Toggle_LEDs(void)
24 {
25     LED_LEFT ^= 1;
26     __delay_ms(100);
27
28     LED_CENTER ^= 1;
29     __delay_ms(100);
30
31     LED_RIGHT ^= 1;
32     __delay_ms(100);
33 }
```

PORT I/O Programming in C

- **Bt**ye-Size Register Access
 - Labels still the same
 - PORTA – PORTD
 - TRISA – TRISD
 - INTCON
- **Bit-Addressable** Register Access
 - PORTBbits.RB3
 - TRISCbits.RC7 or TRISCbits.TRISC7
 - INTCONbits.RBIE

PORT I/O Programming in C

```
TRISB = 0;           //make Port B an output
TRISC = 0;           //make Port C an output
PORTB = 00;          //clear Port B
LED = 0;             //clear Port C
for(;;)              //repeat forever
{
    PORTB++;          //increment Port B
    LED++;           //increment Port C
}
```

```
unsigned char mybyte;
TRISB = 0xFF;        //Port B as input
TRISC = 0;           //Port C as output
while(1)
{
    mybyte = PORTB;  //get a byte from Port B
    MSDelay(500);
    PORTC = mybyte;  //send it to Port C
}
```

PORTxbits.Rxy

Table 7-2: Single-Bit Addresses of PIC18F458/4580 Ports

PORTA	PORTB	PORTC	PORTD	PORTE	Port's Bit
RA0	RB0	RC0	RD0	RE0	D0
RA1	RB1	RC1	RD1	RE1	D1
RA2	RB2	RC2	RD2	RE2	D2
RA3	RB3	RC3	RD3		D3
RA4	RB4	RC4	RD4		D4
RA5	RB5	RC5	RD5		D5
	RB6	RC6	RD6		D6
	RB7	RC7	RD7		D7

PORT I/O Programming in C

```
#include <P18F458.h>
void MSDelay(unsigned int);
#define Dsensor PORTBbits.RB1
#define buzzer PORTCbits.RC7
void main(void)
{
    TRISBbits.TRISB1 = 1;           //PORTB.1 as an input
    TRISCbits.TRISC7 = 0;         //make PORTC.7 an output

    while(Dsensor == 1)
    {
        buzzer = 0;
        MSDelay(200);
        buzzer = 1;
        MSDelay(200);
    }
    while(1);                       //stay here forever
}
```

Write a C18 program to get the status of bit RB0, and send it to RC7 continuously.

Solution:

```
#include <P18F458.h>
#define inbit PORTBbits.RB0
#define outbit PORTCbits.RC7
void main(void)
{
    TRISBbits.TRISB0 = 1;           //make RB0 an input
    TRISCbits.TRISC7 = 0;          //make RC7 an output
    while(1)
    {
        outbit = inbit;            //get a bit from RB0
                                   //and send it to RC7
    }
}
```

.ASM Generated from C

```
1:      #include <P18F458.h>

```

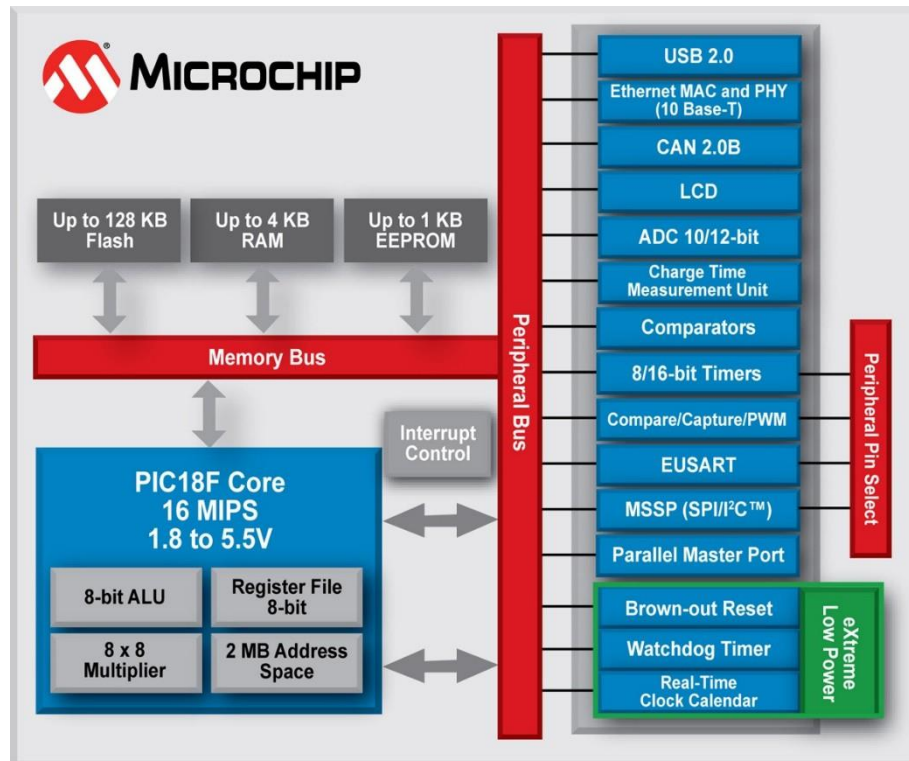

Header Files

- Remember that certain register/variable names are not native C keywords
- They are PIC-specific
 - PORTB, TRISA, TMR0H, PRODL, etc.
- Defined and mapped in header file
 - Using regular data types (char, int, struct, etc.)
- Regular P18Fxxx.h (device) header files
 - C:\Program Files (x86)\Microchip\xc8\v1.20\include

Header Files

- Other functional headers are available

- adc.h
- delays.h
- i2c.h
- pwm.h
- timers.h
- usart.h

- Peripheral library Header Files

- C:\Program Files (x86)\Microchip\xc8\v1.20\include\plib
- C:\Program Files (x86)\Microchip\xc8\v1.20\sources\pic18\plib

Logic Operations in C

- Bit-Wise Operators

		AND	OR	EX-OR	Inverter
A	B	A&B	A B	A^B	Y=~B
0	0	0	0	0	1
0	1	0	1	1	0
1	0	0	1	1	0
1	1	1	1	0	1

- Bit-Wise Shift Operators

- Can shift right/left by X bits

Shift right >>

Shift left <<

Logic Operations in C

```
TRISB = 0;           //make Ports B, C,  
TRISC = 0;           //and D output ports  
TRISD = 0;  
PORTB = 0x35 & 0x0F; //ANDing  
PORTC = 0x04 | 0x68; //ORing  
PORTD = 0x54 ^ 0x78; //XORing  
PORTB = ~0x55;      //inverting  
PORTC = 0x9A >> 3;  //shifting right 3 times  
PORTD = 0x77 >> 4;  //shifting right 4 times  
PORTB = 0x6 << 4;    //shifting left 4 times  
while(1);           //stay here forever
```

```
while(1)  
{  
    PORTB = ~PORTB;  
    PORTC = ~PORTC;  
    MSDelay(250);  
}
```

Binary (hex) to Decimal and ASCII Conversion

- Sometimes we can't handle multiple-digit decimals natively in C for display purposes
- `printf()` is standard for generic C but requires more memory space than a PIC18 is willing to sacrifice
- Best to build your own “custom” print or display functions in C

Extract Single Decimal Digits

- Want each digit of **253** (0b1111101, 0xFD) and convert to ASCII for displaying

Extract Single Decimal Digits

- Want each digit of **253** (0b11111101, 0xFD) and convert to ASCII for displaying

```
1 unsigned char whole, part, d1, d2, d3;  
2  
3 whole = 253; //whole == d3_d2_d1  
4
```

Hex	Dec	Char	Hex	Dec	Char

#define Directive

- Can associate labels with numbers or registers as a constant

```
#define LED_OUTPUT PORTBbits.RB2  
#define MAX_USERS 50
```
