Ans. (i) When the bar magnet moves towards the coil magnetic flux passing through the coil increases as velocity of magnet increases in downward direction, e.m.f. induced also increases, due to formation of similar pole repulsive force decreases the rate of increase of flux.
(ii) once the magnet has passed through the coil, flux decreases in downward direction but $\frac{d \phi}{d t}$ increases as self induced e.m.f. in the coil maintains its flux in the same direction. Thus due to the addition of self induced e.m.f. in same direction according to Lenz's law.

43. A wire in the form of a tightly wound Solenoid is connected to a DC source, and carries a current. If the coil is stretched so that there are gaps between successive elements of the spiral coil, will the current increase or decrease ? Explain?
Ans. When the coil is stretched so that there are gaps between successive elements of the spiral coil i.e. the wires are pulled apart which lead to the flux leak through the gaps. According to Lenz's law, the e.m.f. produced must oppose this decrease, which can be done by an increase in current. So, the current will increase.

Ans.

$$
\begin{aligned}
|\mathrm{E}| & =\mathrm{N} \frac{d \phi}{d t} \\
i & =\frac{\mathrm{E}}{\mathrm{R}}=\frac{\mathrm{N}}{\mathrm{R}} \frac{d \phi}{d t} \\
\frac{d q}{d t} & =\frac{\mathrm{N}}{\mathrm{R}} \frac{d \phi}{d t}

45. Consider a magnet surrounded by a wire with an on/off switch $S$ (figure). If the switch is thrown from the 'off' position (open circuit) to the 'on' position (Closed circuit) will a current flow in the circuit? Explain.

Circuit closed

Ans. $\phi=\mathrm{BA} \cos \theta$ so flux linked will change only when either B or A or the angle between B and A change.

When switch is thrown from off position to the on position, then neither B nor A nor the angle between A and B change. Thus there is no change in magnetic flux linked with the coil, hence no electromotive force (e.m.f.) is produced and consequently no current will flow in the circuit.
