

# Chemical Mediators of Acute Inflammation

**M. Saranyaa**

**Perfusionist & lecturer**

# Chemical mediators

- It is also called as *permeability mediators*
- *Any messenger that acts on blood vessels, inflammatory cells or other cells to contribute to an inflammatory response*
- The chemical mediators have been identified which partake in other processes of acute inflammation as well e.g. vasodilatation, Chemotaxis, fever, pain and cause tissue damage.
- The substances acting as chemical mediators of inflammation may be released *from the cells, the plasma, or damaged tissue*

# Division of Mediators

They are broadly classified into 2 groups:

- *mediators released by cells*
- *mediators originating from plasma*

# Sources and action of mediators

# Cell derived mediators

- *Vasoactive amines* (Histamine, neuropeptides)
- *Arachidonic acid metabolites* (Eicosanoids)
  - i. Metabolites via cyclo-oxygenase pathway (prostaglandins, thromboxane A<sub>2</sub>, prostacyclin)
  - ii. Metabolites via lipo-oxygenase pathway (leukotrienes, lipoxins)
- *Lysosomal components* (from PMNs, macrophages)
- *Platelet activating factor*
- *Cytokines* (IL-1, TNF- $\alpha$ , TNF- $\beta$ , IFN- $\gamma$ , chemokines)
- *Free radicals* (Oxygen metabolites, nitric oxide)

# Vasoactive amines

- **Histamine** = stored in the granules of *mast cells, basophils and platelets*
- Histamine is released because of Stimuli or substances inducing acute inflammation e.g. heat, cold, irradiation, trauma, irritant chemicals, immunologic reactions.

The main *actions* of histamine are:

- *vasodilatation,*
- *increased vascular permeability,*
- *itching*
- *pain.*

Swelling and Inflammation

Adrenaline Release

Bronchoconstriction  
(as in asthma or allergies)

Stimulation of Gastric Acid Secretion

Activated Histamine

Dilation of Blood Vessels

Blood Clotting

Vessels and Capillaries Increase In Permeability

Frequent Heartbeat

# Neuropeptides

- The neuropeptides are also called as substance P , vasoactive intestinal polypeptide (VIP) and Somatostatin
- These small peptides are produced in the central and peripheral nervous systems

The functions are;

- Increased vascular permeability.
- Transmission of pain stimuli.
- Mast cell degranulation

# Arachidonic Acid Metabolites

- Arachidonic acid metabolites or eicosanoids are the *most potent mediators of inflammation*
- Arachidonic acid is a constituent of the *phospholipid cell membrane*.

The two important pathways:

- *cyclooxygenase (COX)*
- *lipoxygenase*
- It is produced by endothelial cells, leukocytes and platelets
- It act locally on smooth muscle, endothelium and platelets.

# Arachidonic Acid Metabolites

## Eicosanoids

signaling molecules  
made by oxidation of fatty acids

Arachidonic acid esterified  
in membrane phospholipid

Arachidonic acid

Cyt P450  
Epoxygenase

aspirin  
NSAIDs

COX 1  
COX 2  
(inducible)

LOX  $\leftarrow$  zileuton

Epoxyeicosatrienoic acids  
(EETs)

Prostanoids  
Prostaglandins  
Prostacyclin (PGI<sub>2</sub>)  
Thromboxane (TXA<sub>2</sub>)

HETEs  
Leukotrienes  $\leftarrow$  montelukast  
zafirlukast  
Lipoxins

# Lysosomal components

- The inflammatory cells— *neutrophils and monocytes*, contain lysosomal granules
- *Lysosomes will break down unwanted microbes*
- *Myeloperoxidase* causes oxidative lysis by generation of oxygen free radicals, acid hydrolases act within the cell to cause destruction of bacteria in *phagolysosome* while proteases attack on the extracellular constituents such as basement membrane, collagen, elastin, cartilage.

# Platelet activating factor

- It is produced by platelets, endothelial cells, leukocytes

## *Functions:*

- platelet aggregation and release
- bronchoconstriction & vasoconstriction [high]
- vasodilation and vascular permeability [low]
- increases leukocyte adhesion & chemotaxis
- increases leukocyte degradation

# Cytokines

- Cytokines are polypeptide substances produced by activated lymphocytes and activated monocytes
- Major cytokines are interleukin-1 (IL-1), tumour necrosis factor (TNF)- $\alpha$  and  $\beta$ , interferon (IFN)- $\gamma$ , and chemokines (IL-8, PF-4)

# Cytokines function

- Increased leucocyte adherence
- thrombogenicity
- elaboration of other cytokines
- fibroblastic proliferation and
- acute phase reactions

# Free Radicals

- Free radicals act as potent mediator of inflammation
- Oxygen-derived metabolites are released from activated neutrophils and macrophages and include superoxide oxygen ( $O_2^-$ ),  $H_2O_2$ , and toxic NO products
- This causes increased vascular permeability

# Chemical Mediators

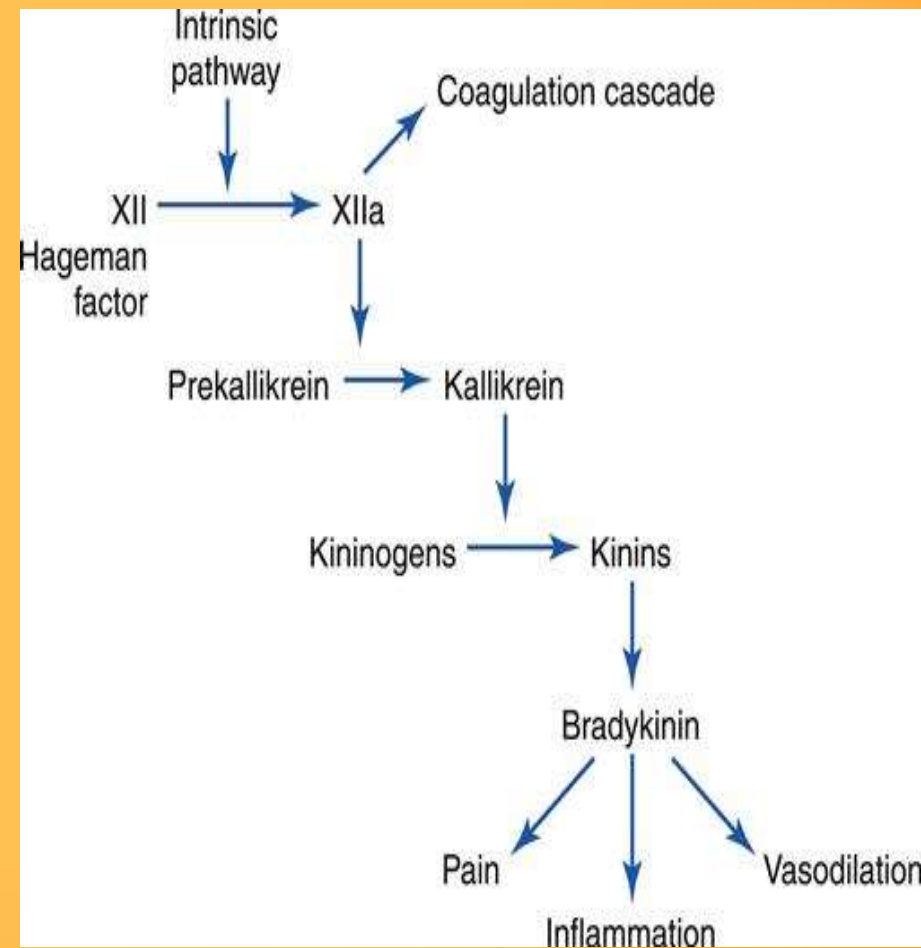

# Plasma-derived mediators

- The kinin system
- The clotting system
- The fibrinolytic system
- The complement system

# The kinin System

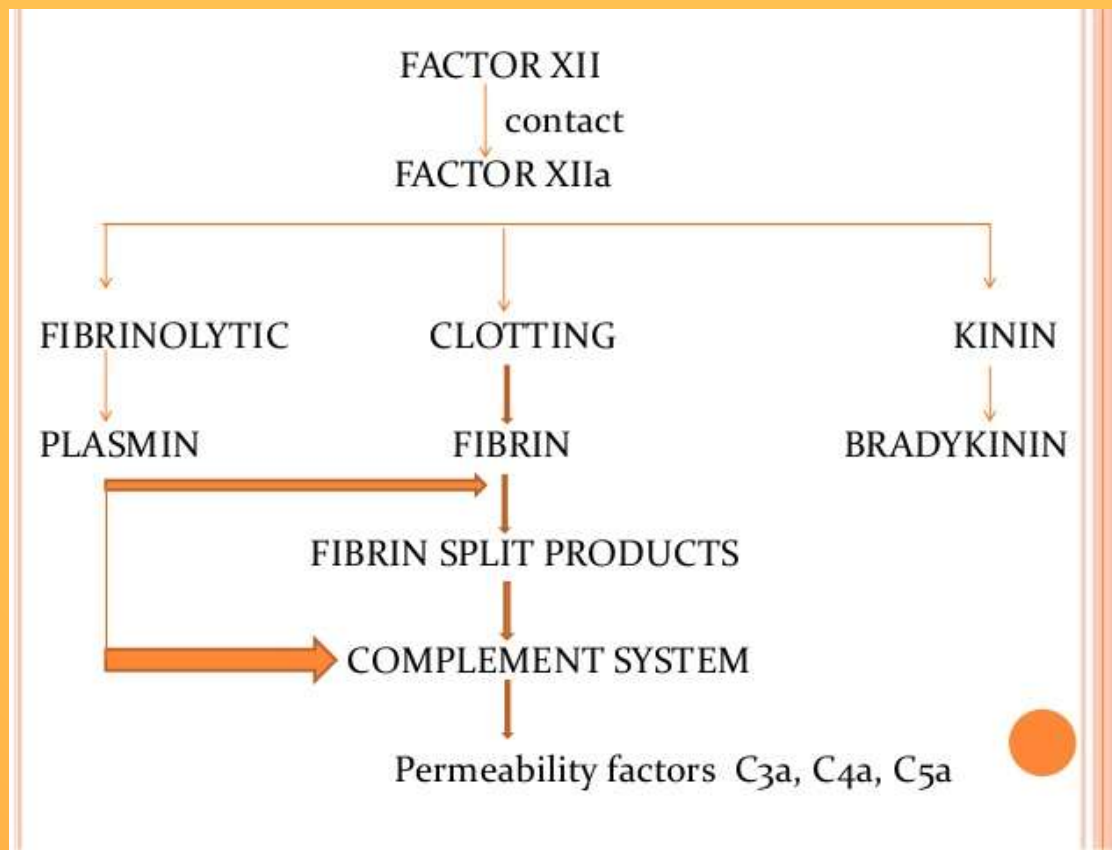

Bradykinin acts in the early stage of inflammation and its effects include:

- smooth muscle contraction;
- vasodilatation;
- increased vascular permeability;
- pain.

# The clotting system & Fibrinolytic system

- Factor XIIa initiates the cascade of the clotting system resulting in formation of fibrinogen which is acted upon by thrombin to form fibrin and fibrinopeptides

# Complement Activation system

- The actions of activated complement system in inflammation are as under:
- C3a, C5a, C4a (anaphylatoxins) activate mast cells and basophils to release of histamine, cause increased vascular permeability causing oedema in tissues, augments phagocytosis.
- C3b is an opsonin.
- C5a is chemotactic for leucocytes.
- Membrane attack complex (MAC) (C5b-C9) is a lipid dissolving agent and causes holes in the phospholipid membrane of the cell.

**THANK YOU**
