

# **SNS COLLEGE OF ENGINEERING**

Kurumbapalayam(Po), Coimbatore - 641 107 Accredited by NAAC-UGC with 'A' Grade Approved by AICTE, Recognized by UGC & Affiliated to Anna University, Chennai

### **Department of Information Technology**

**Course Name – 19IT503 Internet of Things** 

III Year / V Semester

**Unit 1 – IoT INTRODUCTION AND APPLICATIONS** 

**Topic 5- Logical Design of IoT** 

# **Logical Design of IoT** Logical design of an IoT system refers to an abstract representation of the entities and process Application Services Security Management Communication Management, Device

without going into low level specification of the implementations

It consist of

- IoT functional block
- IoT communication model
- IoT communication APIs

### **IoT Functional Block**

- An IoT system comprises of a number of functional blocks that provide the system the capabilities for identification, sensing, actuation, communication and Management.
- Devices, Communication, Services, Security, Application

Logical Design of IoT / Internet of Things /IT / SNSCE

## **Logical Design of IoT – Functional Block**

Devices: devices that provide sensing, actuation, monitoring and control function

Communication: communication block handle the communication systems

Services :

An IoT system uses various types of IoT services such as services for device monitoring , device control services, data publishing services and services for device Discovery.

Management:

Functional blocks provide various functions to govern the IoT system

Security:

Security functional block security IoT system and by providing functions such as application authorization message and content integrity and data security.

Application:

- IoT application provides and interface that the user can used to control and monitor various aspects of the IoT system.

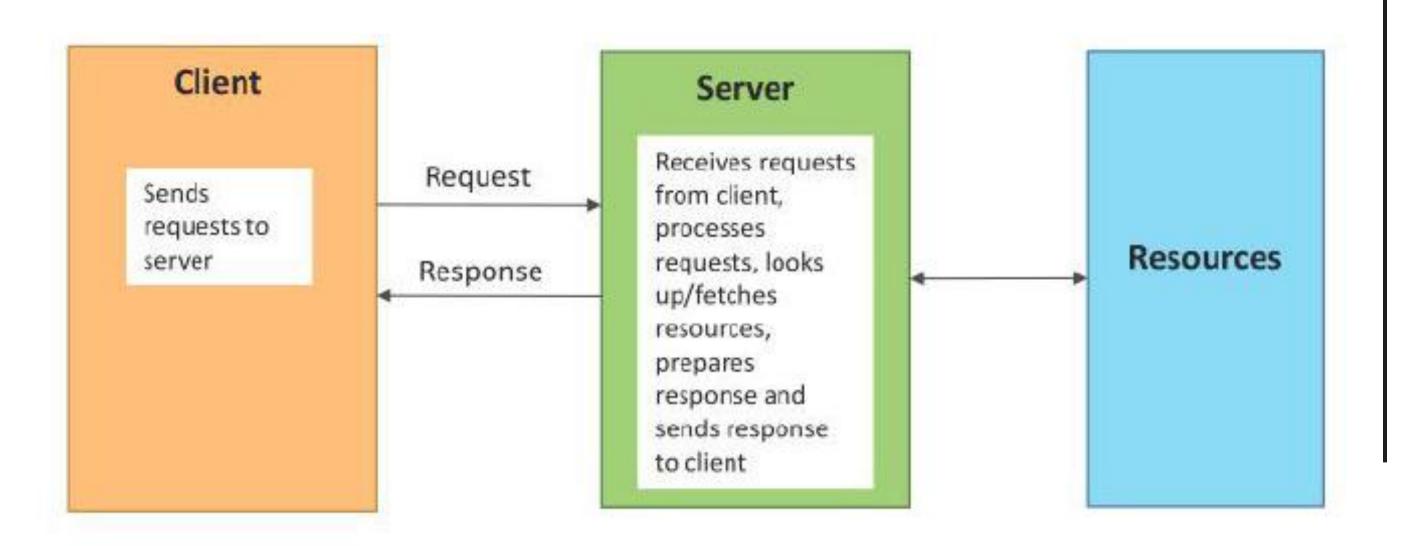

Application also allow users to view the system status and view or analyze the processed to data. Logical Design of IoT / Internet of Things /IT / SNSCE

IoT communication model

- Request response
- Publish Subscribe
- Push pull  $\bullet$
- Exclusive pair

Logical Design of IoT / Internet of Things /IT / SNSCE

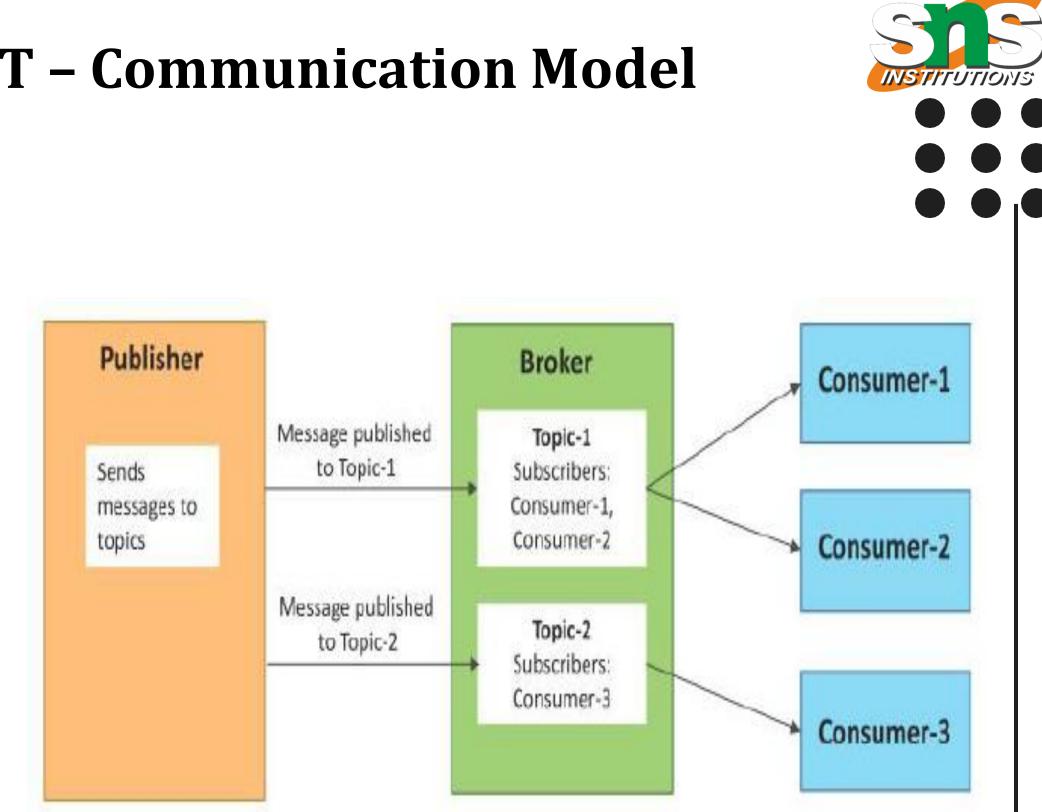

**Request Response** 

### **Publish - Subscribe:**

- Publish-Subscribe is a communication  $\bullet$ model that involves publishers, brokers and consumers.
- Publishers are the source of data.  $\bullet$ Publishers send the data to the topics which are managed by the broker. Publishers of the not aware are consumers
- Consumers subscribe to the topics which  $\bullet$ are managed by the broker.
- When the broker receives data for a topic ulletfrom the publisher, it sends the data to all the subscribed consumers.

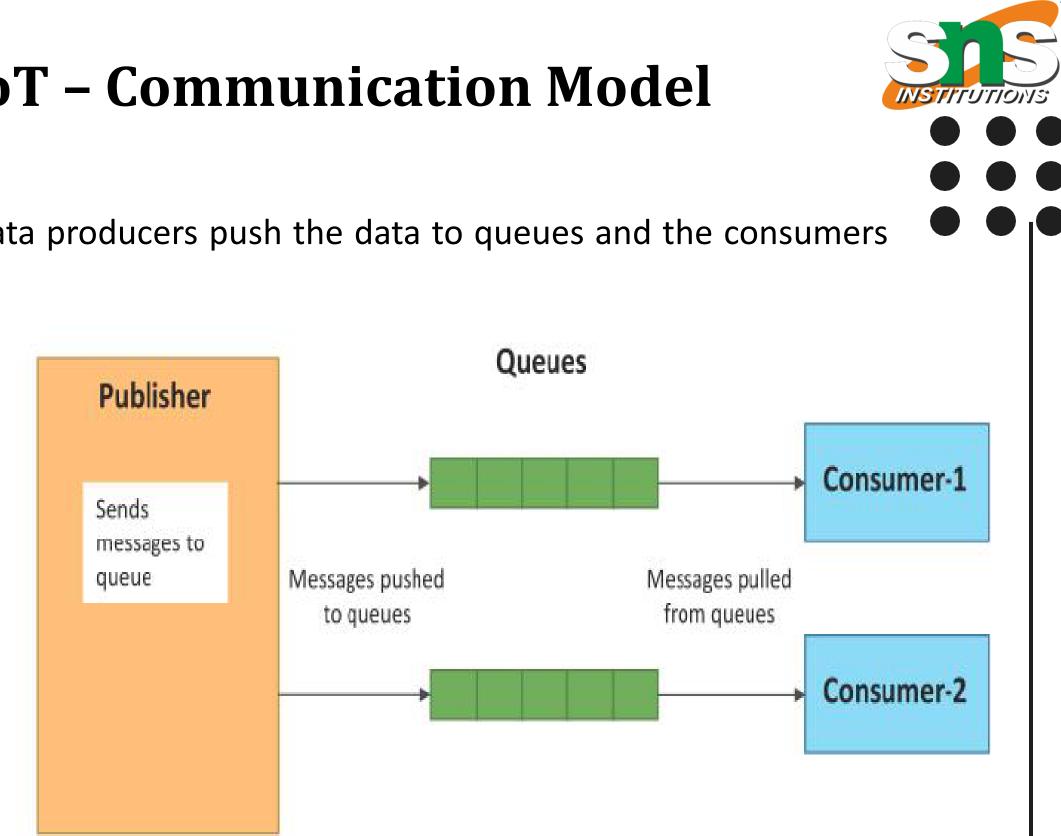

Logical Design of IoT / Internet of Things /IT / SNSCE

#### **Push and Pull**

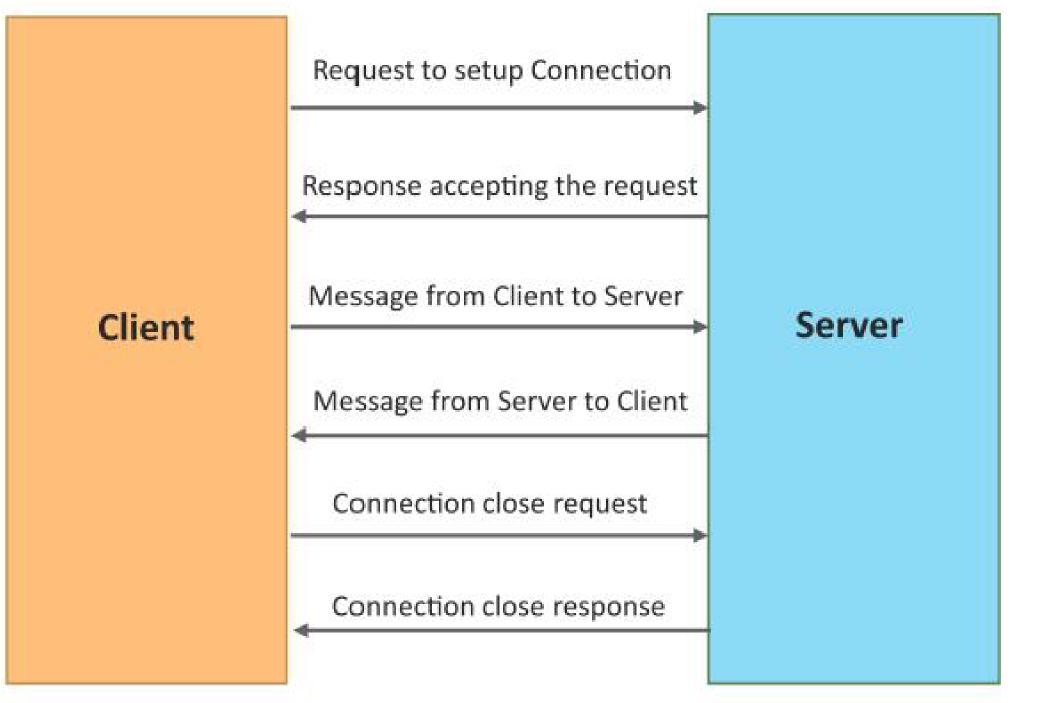

- It's a communication model in which the data producers push the data to queues and the consumers  $\bullet$ pull the data from the queues.
- Producers do not need to be aware of the  $\bullet$ consumers.
- Queues help in decoupling the messaging ۲ between the producers and consumers.
- Queues also act as a buffer which helps in  $\bullet$ situations when there is a mismatch between the rate at which the producers push data and the rate rate at which the consumers pull data.

#### **Exclusive pair**

- Exclusive pair is a bi directional, fully duplex communication model that uses a persistent connections ulletbetween the client and the server.
- Once the connection is setup it remains open until the client sends a request to close the connection.
- Client and server send can messages to each other after connection setup.

Logical Design of IoT / Internet of Things /IT / SNSCE

## **Logical Design of IoT – Communication APIs**

### **IoT communication APIs**

- **REST-** based communication API
- WebSocket based communication API  $\bullet$

### **REST- based communication API**

- Representational state transfer is a set of architectural principles by which you can design web service ۲ and Web API that focus on a system resources and how resource states are addressed the transferred.
- REST API follow the request- response communication model. ۲
- The REST architectural constraints apply to the components, connectors, and data elements.  $\bullet$

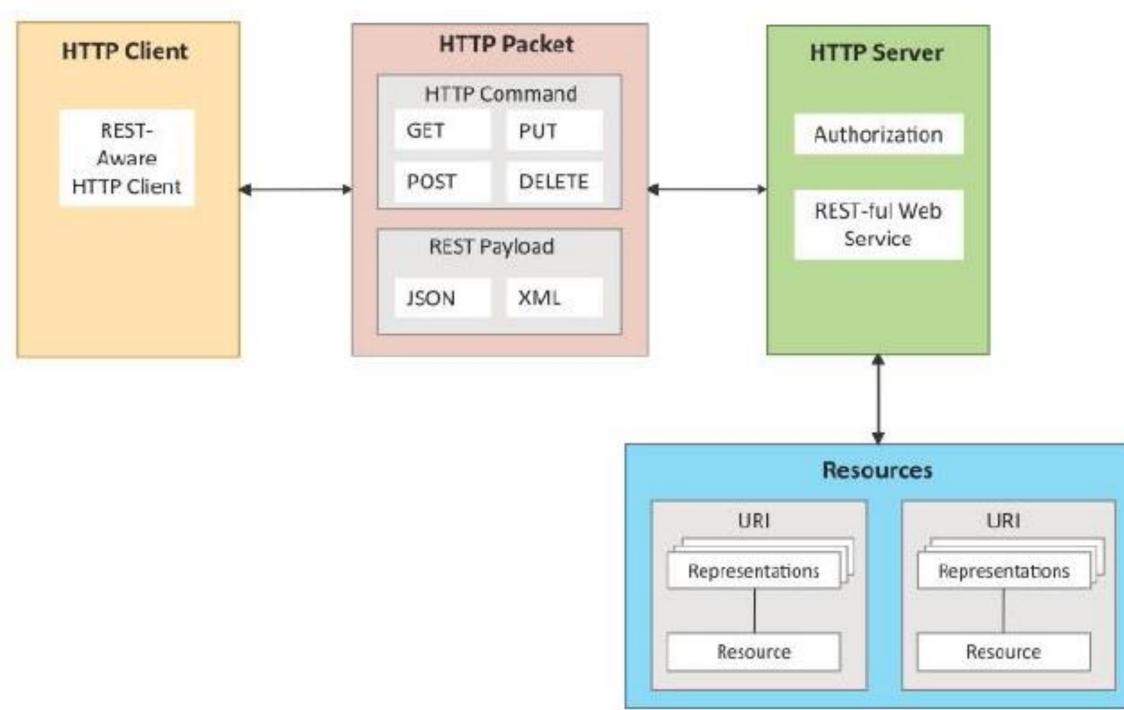

The REST architectural constraints are Client-Server, Stateless, Cache-able, Layered System, Uniform Interface, Code on Command

### **Logical Design of IoT – Communication APIs**

Logical Design of IoT / Internet of Things /IT / SNSCE

### **Logical Design of IoT – Communication APIs**

### WebSocket based communication API

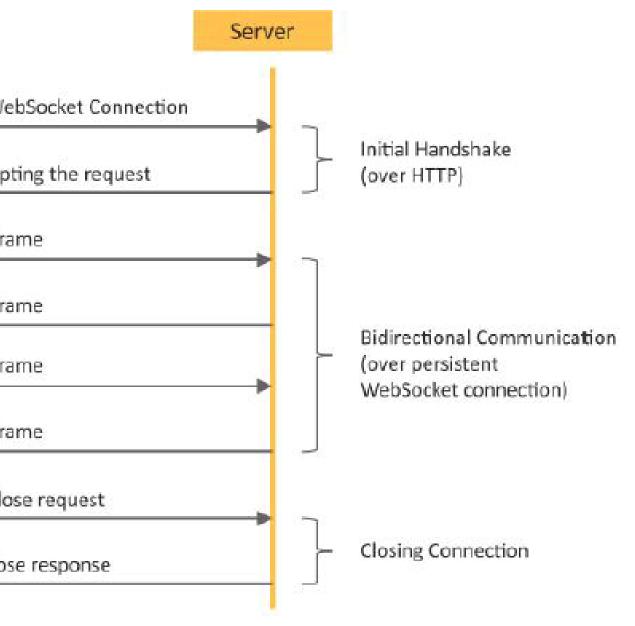

- WebSocket APIs allow bidirectional, full  $\bullet$ duplex communication between clients and servers.
- WebSocket APIs follow the exclusive pair ۲ communication model
- Unlike request-response, Websocket API ● allow full duplex communication and do not require new connection to be set up for each message to be sent.

	WebSocket
Client	
	Request to setup W
