TOPIC:2.-Problems on Strong Induction

Strong Induction In this form, we use the same basic sty as before, but we use a different inductive sty We assume that P(j) is true for j=1,2,-k and We assume that P(j) is true for j=1,2,-k and we assume that P(k+1) must also be true based on this show that P(k+1) must also be true based on this assumption. This is called Strong induction (second principle of Mathematical induction) (second principle of Mathematical induction) (second principle of Mathematical induction) (second principle of Mathematical induction)

Inductive styp: It is shown that  $[P(1) \land P(2) \land \cdots \land P(k)] \rightarrow P(k+1)$ is true for every positive integer K.

1) Show that if n is an integer greater than 1, then n' can be written as the product of primes. Let P(n) be the proposition that n can be written as the product of primes. Basic step: P(2) is true, since 2 can be written as the product of one prime. Inductive step : Assume that P(j) is true for all positive integer j with j < K. To complete the inductive step, it must be shown that P(K+1) is true under this assumption. There are 2 cases to consider, namely Case: 1 If (K+1) is prime, we immediately see that P(K+1) is true Ease: 2 IF (K+1) is composite Then it can be written as product of two positive integer a and b with  $2 \le a < b \le k+1$ . By the induction hypothesis, both a and b can be written as the product of primes. Thus, if (K+1) is composite it can be written as the product of primes.
