Topic : The Chinese remainder theorem- Exponentiation and Logarithms

How many people What is $x$ ?

Divided into 4s: remainder 3 $x \equiv 3(\bmod 4)$

Divided into 5s: remainder 4 $x \equiv 4(\bmod 5)$

## Chinese Remainder Theorem

- used to speed up modulo computations
$\square$ if working modulo a product of numbers $\square \mathrm{eg} . \bmod \mathrm{M}=\mathrm{m}_{1} \mathrm{~m}_{2} \cdot . \mathrm{m}_{\mathrm{k}}$
$\square$ Chinese Remainder - each moduli $\mathrm{m}_{\mathrm{i}}$ works separately
$\square$ since computational cost is proportional to size, this is faster than working in the full modulus M

## Chinese Remainder Theorem

$\square$ can implement CRT in several ways
$\square$ to compute $\mathrm{A}(\bmod \mathrm{M})$
$\square$ first compute all $\mathrm{a}_{\mathrm{i}}=A \bmod \mathrm{~m}_{\mathrm{i}}$ separately
$\square$ determine constants $c_{i}$ below, where $M_{i}=M / m_{i}$
$\square$ then combine results to get answer using

$$
\begin{aligned}
A & \equiv\left(\sum_{i=1}^{k} a_{i} c_{i}\right)(\bmod M) \\
c_{i} & =M_{i} \times\left(M_{i}^{-1} \bmod m_{i}\right) \quad \text { for } 1 \leq i \leq k
\end{aligned}
$$

Theorem: If $m_{1}, m_{2}, \ldots, m_{k}$ are relatively prime and $a_{1}, a_{2}, \ldots, a_{k}$ are integers, then

$$
\begin{aligned}
& x \equiv a_{1}\left(\bmod m_{1}\right) \\
& x \equiv a_{2}\left(\bmod m_{2}\right)
\end{aligned}
$$

$$
x \equiv a_{k}\left(\bmod m_{k}\right)
$$

have a unique solution modulo $m$, where $m=m_{1} m_{2} \ldots m_{k}$. (That is, there is a solution $x$ with $0 \leq x<m$ and all other solutions are congruent modulo $m$ to this solution.)
(1) Compute $m=m_{1} m_{2} \ldots m_{n}$.
(2) Determine $M_{1}=m / m_{1} ; \quad M_{2}=m / m_{2} ; \ldots ; \quad M_{n}=m / m_{n}$
(3) Find the inverse of $M_{1} \bmod m_{1}, M_{2} \bmod m_{2}, \ldots, M_{n}$ $\bmod m_{n}$ which are $y_{1}, y_{2}, \ldots, y_{n}$,

$$
M_{k} y_{k} \equiv 1\left(\bmod m_{k}\right)
$$

(4) Compute $x=a_{1} M_{1} y_{1}+a_{2} M_{2} y_{2}+\ldots+a_{n} M_{n} y_{n}$
(5) Solve $x \equiv y(\bmod m)$

Example : Solve the system of congruences

$$
x \equiv 2(\bmod 3), x \equiv 3(\bmod 5), x \equiv 2(\bmod 7)
$$

Solution:
(1) $\mathrm{m}=3 \cdot 5 \cdot 7=105$
(2) $M_{1}=m / m_{1}=105 / 3=35, M_{2}=21 ; M_{3}=15$
(3) $y_{1}=2$ is an inverse of $35 \bmod 3$ because $35 \equiv 2(\bmod 3)$
$y_{2}=1$ is an inverse of $21 \bmod 5$ because $21 \equiv 1(\bmod 5)$
$y_{3}=1$ is an inverse of $15 \bmod 7$ because $15 \equiv 1(\bmod 7)$
(4) $x=a_{1} M_{1} y_{1}+a_{2} M_{2} y_{2}+a_{3} M_{3} y_{3}$

$$
=2 \cdot 35 \cdot 2+3 \cdot 21 \cdot 1+2 \cdot 15 \cdot 1=233
$$

(5) $233 \equiv 23(\bmod 105)$

## $x \equiv 2(\bmod 3), x \equiv 3(\bmod 5), x \equiv 2(\bmod 7)$

## $233 \equiv 23(\bmod 105)$

We conclude that 23 is the smallest positive integer that:
$23 \bmod 3=2$
$23 \bmod 5=3$
$23 \bmod 7=2$

Activity

## Discrete Logarithms

$\square$ Let $g$ be the generator of the group $\mathrm{Z}_{n}{ }^{*}$. Given an element $\mathrm{y}=\mathrm{g}^{\mathrm{x}}(\bmod$ $n$ ) the discrete logarithm is defined as $\operatorname{dlog}_{n, g}(y)=x$.

## Properties of logarithms

$$
\begin{aligned}
& \square \log _{\mathrm{a}} 1=0 \\
& \log _{\mathrm{a}} \mathrm{a}=1 \\
& \log _{\mathrm{a}} \mathrm{xy}=\log _{\mathrm{a}} \mathrm{x}+\log _{\mathrm{a}} \mathrm{y} \\
& \log _{\mathrm{a}} \mathrm{x}^{\mathrm{n}}=\operatorname{nlog}_{\mathrm{a}} \mathrm{x}
\end{aligned}
$$

## Properties of Discrete Logarithms

$$
\begin{aligned}
& \square \operatorname{dog}_{\mathrm{n}, \mathrm{~g}}(1)=0 \quad \mathrm{~g}^{0}=1(\bmod \mathrm{n}) \\
& \square \operatorname{dlog}_{\mathrm{ng}}(\mathrm{~g})=1 \quad \mathrm{~g}^{1}=\mathrm{g}(\bmod \mathrm{n}) \\
& \square \operatorname{dlog}_{\mathrm{n}, \mathrm{~g}}(\mathrm{xy})=\left(\operatorname{dlog}_{\mathrm{n}, \mathrm{~g}}(\mathrm{x})+\operatorname{dlog}_{\mathrm{n}, \mathrm{~g}}(\mathrm{y})\right)(\bmod (\Phi(\mathrm{n})) \\
& \left.\square \operatorname{dlog}_{\mathrm{n}, \mathrm{~g}} \mathrm{x}^{\mathrm{r}}=\mathrm{r} \operatorname{dlog}_{\mathrm{n}, \mathrm{~g}} \mathrm{x}\right)(\bmod \Phi(\mathrm{n}))
