AN AUTONOMOUS INSTITUTION

Accredited by NBA - AICTE and Accredited by NAAC-UGC with 'A' Grade
Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

19CH101– ENGINEERING CHEMISTRY

Unit-1 WATER AND ITS TREATMENT

WATER

Water is made up of hydrogen and oxygen, and it exists in gaseous, liquid, and solid states. Water is one of the most plentiful and essential compounds, occurring as a liquid on Earth's surface under normal conditions, which makes it invaluable for human uses and as plant and animal habitat.

Water is the most important compound for the existence of human beings, animals and plants and occupies a unique position in industries. About 75% of the earth's surface is occupied by water. The main sources of water are surface water- rain, rivers and lakes, sea water and underground water- wells and springs etc.

CHARACTERISTICS OF WATER:

Unique Characteristics:

1. Water is polar in nature.
2. It is a good solvent for the ionic compounds and it dissolves almost all substances (solid, liquid or gas). Hence, it is known as universal solvent.
3. Has High Heat capacity
4. Has High heat of vaporization
5. The density of water is maximum at 4⁰C, which is equal to 1000 kg m⁻³. It is Less dense as a solid than as a liquid
6. It exists in three states ie., solid, liquid and gas. The solid form of water is known as ice. It exists only below 0⁰C. It exists as a liquid between 0 and 100⁰ C and as gas (steam) above 100⁰C. Hence the boiling point of water is 100⁰C (373K) and freezing point is 0⁰C (273K).

7. Pure water is a transparent, colourless, odourless and tasteless liquid.
8. Pure water is a bad conductor of electricity, but acidified water is an electrolyte.
