DESIGN AND ANALYSIS OF ALGORITHMS

QUESTION BANK

4

DESIGN AND ANALYSIS OF ALGORITHMS T P C 3 0 0 3 OBJECTIVES:

- To understand and apply the algorithm analysis techniques.
- To critically analyze the efficiency of alternative algorithmic solutions for the same problem
- To understand different algorithm design techniques.
- To understand the limitations of Algorithmic power.

UNIT I INTRODUCTION

Notion of an Algorithm – Fundamentals of Algorithmic Problem Solving – Important Problem Types-Fundamentals of the Analysis of Algorithmic Efficiency –Asymptotic Notations and their properties. Analysis Framework – Empirical analysis - Mathematical analysis for Recursive and Non-recursive algorithms - Visualization

UNIT II BRUTE FORCE AND DIVIDE-AND-CONQUER

Brute Force – Computing aⁿ – String Matching - Closest-Pair and Convex-Hull Problems -Exhaustive Search - Travelling Salesman Problem - knapsack Problem - Assignment problem.Divide and Conquer Methodology – Binary Search – Merge sort – Quick sort – Heap Sort - Multiplication of Large Integers – Closest-Pair and Convex - Hull Problems.

UNIT III DYNAMIC PROGRAMMING AND GREEDY TECHNIQUE

Dynamic programming – Principle of optimality - Coin changing problem, Computing a Binomial Coefficient – Floyd's algorithm – Multi stage graph - Optimal Binary Search Trees – knapsack Problem and Memory functions. Greedy Technique – Container loading problem - Prim's algorithm and kruskal's Algorithm – 0/1 knapsack problem, Optimal Merge pattern - Huffman Trees.

UNIT IV ITERATIVE IMPROVEMENT

The Simplex Method - The Maximum-Flow Problem – Maximum Matching in Bipartite Graphs, Stable marriage Problem.

UNIT V COPING WITH THE LIMITATIONS OF ALGORITHM POWER

Lower - Bound Arguments - P, NP NP- Complete and NP Hard Problems. Backtracking – n-Queen problem - Hamiltonian Circuit Problem – Subset Sum Problem. Branch and Bound – LIFO Search and FIFO search - Assignment problem – Knapsack Problem – Travelling

9

9

9

9

Salesman Problem - Approximation Algorithms for NP-Hard Problems – Travelling Salesman problem – Knapsack problem.

TOTAL: 45 PERIODS

<u>UNIT I</u>

Q. No.	Questions	СО	Bloo m's Level
1	Define Algorithm. [MAY/JUNE 2013] APRIL/MAY 2017,NOV/DEC 2018 An algorithm is a sequence of unambiguous instructions for solving a problem in a finite amount of time	C213.1	BTL1
2	Compare Time Efficiency and Space Efficiency? [<u>APRIL/MAY 2010</u>] Time Efficiency measured by counting the number of times the algorithms basic operation is executed. Space Efficiency is measured by counting the number of extra memory units consumed by the algorithm	C213.1	BTL 2
3	What is Big 'Oh' Notation? [MAY/JUNE 2013, MAY/JUNE 2012] The Big 'Oh' notation provides an upper bound for the function t.A function $t(n)$ is said to be in $O(g(n))$, if there exist some positive constant C and some non negative number No, such that , t(n) <= Cg(n), for all $n >= no$	C213.1	BTL 1
4	Analyze the time complexity using the step count method when 2 m X n matrices are added. [<u>APRIL / MAY 2011</u>] Time complexity = $\Theta(mn)$	C213.1	BTL 4
5	What is a recurrence equation? [APRIL/MAY 2010] An equality or inequality describing the function in terms of its behavior on smaller inputs $T(n) = T(n-1) + c$; $T(1) = 1$.	C213.1	BTL 1
6	An array has exactly n nodes. They are filled from the set {0,1,2, ,n- 1,n}. There are no duplicates in the list. Design an O(n) worst case time algorithm to find which one of the elements from the above set is missing in the array. [<u>APRIL / MAY 2011]</u> int linearsearch(int a[], int size, int ch) { for(int i=0;i <size;i++) { if(a[i]==ch) return(i); }</size;i++) 	C213.1	BTL 6

	If $f(n) = Q(n^n)[NOV/$		
	DEC 2010]		
	f(n) < = a n $(a n)$		
			вті
7	Æ	C213.1	BTI 5
			5.23
	i⊕		
	$f(m) = Q(n^{n})$ assuming that m is constant		
	What is the properties of Asymptotic notation[NOV / DEC		
	<u>2011,MAY/JUNE 2015]</u>		
o		C213.1	BTL 1
0	b. Any function can be said as an order of itself.		
	c. Any constant value is equivalent to $O(1)$		
	What is meant by linear search? [NOV/DEC 2011, MAY/JUNE 2012]		
	value in a list that consists of checking every one of its elements one at a		
	time and in sequence, until the desired one is found.	C213.1	BTL 1
9	Best case $-\Omega(1)$		
	Worst case $-O(n)$		
	Average case $-O(n)$		
	Develop an algorithm to find the number of binary digits in the binary		
	representation of a positive decimal number. [MAY/JUNE 2015]		
	ALGORITHM Binary(n)		
	//Input: A positive decimal integer n		рті
10	<i>nourbut:</i> The number of binary digits in <i>n</i> 's binary representation $count = 1$	C213.1	
10	while $n > 1$ do		DILO
	$count \leftarrow count + 1$		
	$n \leftarrow \lfloor n/2 \rfloor$		
	return count		
	What is meant by Notion of Algorithm		
	Problem		
		C213.1	BTL 1
	Algorithm		
	\perp		

11	Input Computer Output		
12	What are the 2 Kinds of Algorithm Efficiency Time Efficiency-How fast your algorithm runs? Space Efficiency-How much extra memory your algorithm needs?	C213.1	BTL 1
13	What is Pseudo Code? Pseudo Code is a mixture of Natural Language and Programming Language Constructs such as functions, loops, decision making statementsetc	C213.1	BTL 1
14	Show the Euclid Algorithm MAY/JUNE 2016,APR/MAY 2018 Algorithm Euclid(m,n) Step 1: While n not equal do Step 2: r = m mod r Step 3: m=n Step 4: n=r Step 5: return n	C213.1	BTL 1
15	 What are the different types of time complexity? The time complexity can be classified into 3 types, they are Worst case analysis Average case analysis Best case analysis 	C213.1	BTL 1
16	What is recursive algorithm? Write an algorithm using Recursive function to fine sum of n numbers,An algorithm is said to be recursive if the same algorithm is invoked in the body. An algorithm that calls itself is Direct recursive. Algorithm A is said to be indeed recursive if it calls another algorithm, which in turn calls A.algorithm using Recursive function to fine sum of n numbers, Algorithm Rsum (a,n) { If $(n \le 0)$ then Return 0.0; Else Return Rsum $(a, n - 1) + a(n);$ }	C213.1	BTL 1
17	 Classify Algorithm Design and Analysis of Process. Understand the problem Decide on computational means Exact Vs Approximate Algorithms Data Structures Algorithm Design techniques Design an algorithms Prove Correctness Analyze the Algorithm 	C213.1	BTL 4

	Code the algorithm		
18	How can you specify Algorithms? Algorithms can be specified in a natural language or pseudo code.	C213.1	BTL1
19	List the important Problem Types? Sorting Searching String Processing Graph Problem Combinatorial Problem Geometric Problem Numerical Problem 	C213.1	BTL4
20	What is amortized efficiency? In some situations a single operation can be expensive, but the total time for the entire sequence of n such operations is always significantly better that the worst case efficiency of that single operation multiplied by n. this is called amortized efficiency.	C213.1	BTL1
21	What is Sorting Problem? Sorting algorithm is rearranging the items of a given list in descending/ascending order. Sorting algorithms classified into Stable Sorting Algorithm Non-Stable Algorithm	C213.1	BTL1
22	What is Searching Problem? Finding a given value, called search key in a given set. Searching Algorithms needs more memory space and sorted array.	C213.1	BTL1
23	What is Graph Problem? Graph is a collection of edges and vertices. G=(V,E). For eg. Traversal Algorithms, Shortest Path Algorithm, Graph Coloring Problem	C213.1	BTL1
24	What is Combinatorial Problem? This problem that ask to find a combinatorial object such as permutations, combinations or a subset. Combinatorial problems are most difficult to solve. For eg Traveling sales man problem	C213.1	BTL1
25	 List the features of efficient algorithm? Free of ambiguity Efficient in execution time Concise and compact Completeness Definiteness Finiteness 	C213.1	BTL4

26	Define Order of Algorithm.The order of algorithm is a standard notation of an algorithm that has been developed to represent function that bound the computing time for algorithms.The order of an algorithm is a way of defining its efficiency. It is usually referred as O-notation	C213.1	BTL1
27	Illustrate the different criteria used to improve the effectiveness of algorithm? Input- Zero or more quantities are externally supplied Output-At least one quantity is produced Definiteness-Each instruction is clear and unambiguous Finiteness-If we trace out the instructions of an algorithm, then for all case the algorithm terminates after a finite number of steps Effectiveness-Every instruction must be very clear	C213.1	BTL2
29	 What is the substitution method? One of the methods for solving any such recurrence relation is called the substitution method. Types of Substitution : Forward Substitution Backward Substitution 	C213.1	BTL1
30	Define the asymptotic t \notation "theta" (θ) The function $f(n) = \theta$ (g(n)) if there exist positive constant C ₁ , C ₂ , and no such that C ₁ g(n) \leq f(n) \leq C ₂ g(n) for all n, n \geq n ₀ .	C213.1	BTL1
31	 What is a basic operation? APR/MAY 2018 A basic operation is one that best characterizes the efficiency of the particular algorithm of interest For time analysis it is the operation that we expect to have the most influence on the algorithm's total running time: key comparisons in a searching algorithm Numeric multiplications in a matrix multiplication algorithm Visits to nodes (or arcs) in a graph traversal algorithm For space analysis it is an operation that increases memory usage A procedure call that adds a new frame to the run-time stack Creation of a new object or data structure in the run-time heap The basic operation may occur in more than one place in the algorithm 	C213.1	BTL1
32	What is performance measurement? Performance measurement is concerned with obtaining the space and the time requirements of a particular algorithm.	C213.1	BTL1

33	List the desirable properties The characteristics of a good a Precision – the steps are precis Uniqueness – results of each st the input and the result of the p Finiteness – the algorithm stop executed. Input – the algorithm receives Output – the algorithm produc Generality – the algorithm app	of algorithm.NOV/DEC 2018 lgorithm are: sely stated(defined). tep are uniquely defined and only dep preceding steps. os after a finite number of instructions input. es output. lies to a set of inputs.	bend on S are	C213.1	BTL1
34	Give the two major phases of Performance evaluation can b prior estimates (performance a measurement)	f performance evaluation e loosely divided into two major phas nalysis) (ii) a Posterior testing(perfor	ses: (i) a mance	C213.1	BTL1
35	Define input size. The input size of any instance words(or the number of element	of a problem is defined to be the nun nts) needed to describe that instance.	iber of	C213.1	BTL1
36	Define best-case step count. The best-case step count is the executed for the given parame	minimum number of steps that can b ters.	be	C213.1	BTL1
37	Define worst-case step count The worst-case step count is the executed for the given parame	• ne maximum number of steps that car ters.	ı be	C213.1	BTL1
38	Define average step count. The average step count is the a with the given parameters.	average number of steps executed an	instances	C213.1	BTL1
39	Define best , worst, average cas Best, worst, and average cas the resource usage is at least, the resource being considered could also be memory or oth performs the minimum number case is the function which per- data of size n. Average case number of steps on input data	be time complexity.NOV/DEC2018 ses of a given algorithm express at most and on average, respectively l is running time, i.e. time complexi- er resource. Best case is the functi- er of steps on input data of n element forms the maximum number of steps is the function which performs an of n elements.	s what y. Usually ity, but it on which ts. <u>UNIT II</u>

Q. No.	Questions	СО	Bloo m's Leve l
1	Define Convex-Hull Problem. A set of points (finite or infinite) on the plane is called convex if for any two points P and Q in the set, the entire line segment with the end points at P and Q belongs to the set.	C213.2	BTL1
2	What is Divide and Conquer Algorithm?[MAY/JUNE 2016] NOV/DEC 2017 It is a general algorithm design techniques that solved a problem's instance by dividing it into several smaller instance, solving each of them recursively, and then combining their solutions to the original instance of the problem	C213.2	BTL1
3	What is Fibonacci Numbers? The Fibonacci numbers are an important sequence of integers in which every element is equal to the sum of its two immediate predecessors. There are several algorithms for computing the Fibonacci numbers with drastically different efficiency.	C213.2	BTL1
4	What is Brute Force method? Brute Force is a straightforward approach to solving problem, usually directly based on the problem's statement and definitions of the concepts involved.	C213.2	BTL1
5	 List out the Advantages in Quick Sort It is in-place since it uses only a small auxiliary stack It requires only n log(n) time to sort n items It has an extremely short inner loop This algorithm has been subjected to a thorough mathematical analysis, a very precise statement• can be made about performance issues 	C213.2	BTL4
6	Discuss binary search algorithm and Give computing time for Binary search? [MAY/JUNE 2015] The binary search algorithm is one of the most efficient searching techniques which requires the list to be sorted in ascending order. To search for an element in the list, the binary search algorithms split the list and locate the middle element of the list. First compare middle Key k1, with given Key If k1=k then the element is found. Successful searches $\theta(1)$ $\theta(\log n)$ $\theta(Log n)$ best average	C213.2	BTL6

	worst		
	unsuccessful searches $\theta(\log n)$ best, average, worst		
7	List the advantages of insertion sort. NOV/DEC 2017 Simple implementation. Efficient for (quite) small data sets. Adaptive, i.e. efficient for data sets that are already substantially sorted.	C213.2	BTL4
8	Show the recurrence relation of divide-and-conquer? The recurrence relation is $T(n) = \begin{cases} g(n) \\ T(n_1) + T(n_2) + \dots + T(n_{BTL}) + f(n) \end{cases}$	C213.2	BTL2
9	What is exhaustive search? APR/MAY 2018 A brute force solution to a problem involving search for an element with a special property, usually among combinatorial objects such as permutations, combinations, or subsets of a set.	C213.2	BTL2
10	Elaborate the recurrence relation of merge sort? If the time for the merging operation is proportional to n, then the computing time of merge sort is described by the recurrence relation T(n) = A $T(n) = A$ $T(n) =$	C213.2	BTL6
11	What is Knapsack problem? A bag or sack is given capacity n and n objects are given. Each object has weight wi and profit pi .Fraction of object is considered as xi (i.e) $0 <= xi <= 1$.If fraction is 1 then entire object is put into sack. When we place this fraction into the sack we get w _i x _i and p _i x _i .	C213.2	BTL1
12	What is the use of TSP? The traveling salesman problem (TSP) is a popular mathematics problem that asks for the most efficient trajectory possible given a set of points and distances that must all be visited. In computer science, the problem can be applied to the most efficient route for data to travel between various nodes.	C213.2	BTL1
13	Design a brute-force algorithm for computing the value of a polynomial $p(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x \dots a_0$ at a given point and determine its worst-case efficiency class. [MAY/JUNE 2015] Algorithm BetterBruteForcePolynomialEvaluation(P[0n], x) //The algorithm computes the value of polynomial P at a given point x //by the "lowest-to-highest term" algorithm //Input: Array P[0n] of the coefficients of a polynomial of degree n, // from the lowest to the highest, and a number x //Output: The value of the polynomial at the point x $p \leftarrow P[0];$ power $\leftarrow 1$ for $i \leftarrow 1$ to n do power \leftarrow power * x $p \leftarrow p + P[i] * power$	C213.2	BTL6

	return p Worst case efficiency $\in n^2$		
	What is the Quick sort and Write the Analysis for the Quick sort?		
14	In quick sort, the division into sub arrays is made so that the sorted sub arrays do not need to be merged later. In analyzing QUICKSORT, we can only make the number of element comparisons c(n). It is easy to see that the frequency count of other operations is of the same order as C(n).	C213.2	BTL1
	Define Sum of Subsets problem.	C213.2	DTI 1
15	Given n distinct positive numbers usually called as weights, the problem calls for finding all the combinations of these numbers whose sums are m.	C213.2	DILI
	List out the 4 steps in Strassen's Method?		
	1. Divide the input matrices A and B into $n/2 * n/2$ sub matrices, as in		
16	equation (1). 2. Using $\Theta(n2)$ scalar additions and subtractions, compute 14 n/2 * n/2 matrices A1, B1, A2, B2,, A7, B7.	C213.2	BTL4
	3. Recursively compute the seven matrix products Pi =AiBi for i =1, 2, 7. 4. Compute the desired sub matrices r, s, t, u of the result matrix C by adding and/or subtracting various combinations of the Pi matrices, using only $\Theta(n2)$ scalar additions and subtractions		
	What is approximate solution?	~ ~ ~ ~ ~	
17	A feasible solution with value close to the value of an optimal solution is called approximate solution.	C213.2	BTL1
	Give the time efficiency and drawback of merge sort algorithm.		
	Time efficiency : The best, worst and average case time complexity of		
18	Time efficiency : The best, worst and average case time complexity of merge sort is O(nlogn) The drawheeks : (I) This algorithm requires every storage to every this	C213.2	BTL1

22	Define recursive call? An algorithm is said to be recursive if the same algorithm invoked in the body. There are 2 types of algorithm. They are 1) Direct Recursive 2) Indirect Recursive	C213.2	BTL1
23	What is meant by Direct recursive call? An algorithm that calls itself is direct recursive call. Eg. int fun(int x) { if(x<=0) return x; return (fun(x-1));	C213.2	BTL1
24	Define indirect recursive call? Algorithm A is said to be indirect recursive if it calls another algorithm which in turn call A Eg: int fun(int x) { if(x<=0) return x; return (f1(x-1)); } Int fun1(int y){ return fun(y-1) }	C213.2	BTL1
25	Define Extrapolation? Extrapolation is approach, which deals with values of n, that are outside of the range of the samples values.	C213.2	BTL1
26	Define profiling? Profiling is an important resource the empirical analysis of an algorithm running time. Measuring n different segments of program can pinpoint a bottleneck in the program's performance that can be missed by an abstract deliberation about the algorithm's basic operations. The process of getting such data is called profiling.	C213.2	BTL1
27	What is closest pair problem? MAY/JUNE 2016, APRIL/MAY 2017 The closest pair problem is to find the two closest points in a set of n points. The distance between two Cartesian coordinates is calculated by Euclidean distance formula. d(pi,pj)=(xi-xj)2+(yi-yj)2	C213.2	BTL1
28	Illustrate the Assignment problem? MAY/JUNE 2016 There are n people who need to be assigned to execute n jobs as one person per job. Each person is assigned to exactly one job and each job is assigned to exactly one person.	C213.2	BTL2
29	Define of feasibility A feasible set (of candidates) is promising if it can be extended to produce not merely a solution, but an optimal solution to the problem.	C213.2	BTL1
30	What is the general divide-and-conquer recurrence relation? An instance of size _n' can be divided into several instances of size n/b, with _a' of them needing to be solved. Assuming that size _n' is a power of _b', to simplify the analysis, the following recurrence for the running time is obtained: $T(n) = aT(n/b)+f(n)$ Where $f(n)$ is a function that accounts for the time spent on dividing the problem into smaller ones and on combining their solutions	C213.2	BTL1
31	State Master's Theorem. APR/MAY 2018 Master Method is a direct way to get the solution. The master method works only for following type of recurrences or for recurrences that can be	C213.2	BTL1

	transformed to following type.		
	$T(n) = aT(n/b) + f(n)$ where $a \ge 1$ and $b \ge 1$		
	There are following three cases: 1. If $f(n) = \Theta(n^c)$ where $c < \text{Log}_b a$ then $T(n) = \Theta(n^{\text{Log}}_b a)$		
	2. If $f(n) = \Theta(n^c)$ where $c = Log_b a$ then $T(n) = \Theta(n^c Log n)$		
	3. If $f(n) = \Theta(n^c)$ where $c > Log_b a$ then $T(n) = \Theta(f(n))$		
	Is insertion sort better than the merge sort?		
32	Insertion sort works exceedingly fast on arrays of less then 16 elements,	C213.2	BTL1
	though for large "," its computing time is $O(n2)$.		
	Write a algorithm for straightforward maximum and minimum		
	algorithm .		
	straight Maximin(a,n,max,min) //set max to the maximum and min to the minimum of $a[1:n]$		
	$\max := \min := a[i]$		
33	for $i = 2$ to n do	C213.2	BTL1
	{		
	if(a[i] > max) then		
	$\max := a[i];$		
	if(a[i] >min) then		
	$\min: = a[i];$		
	}		
	Write the algorithm for Iterative binary search?		
	Algorithm BinSearch(a,n,x) //Given an array a[1:n] of elements in		
34	nondecreasing // order, n>0, determine whether x is present { low : = 1; high	C213.2	BTL1
0.	$= n;$ while (low < high) do { mid : = [(low+high)/2]; a[mid]) then high:=		
	$mid-1; then low:=mid$		
	What is the method of backward substitution?		
	Among several techniques available for solving recurrence relations, one of the method used is called the method of healward substitution. The method's	0212.2	
35	the method used is called the method of backward substitution. The method s idea will be clear by referring to the particular case as shown below : $M(n) =$	C213.2	BIL1
	M(n-1) + 1 for $n > 0$ $M(0) = 0 = [M(n-2) + 1] + 1 = M(n-2) + 2 = [M(n-3)]$		
	M(n-1) + 1 for $n > 0$. $M(0) = 0 = [M(n-2) + 1] + 1 = M(n-2) + 2 = [M(n-3) + 1] + 2 = M(n-3) + 3 = M(n-n) + n = n$		
	Give some examples of Brute force approach?	C213.2	BTI 1
36	a) Selection sort b) bubble sort c) string matching	C215.2	DILI
	What is the principal strength of brute force approach?	C213.2	BTL1
37	Wide applicability and simplicity	021012	
	What is a pivot?	C212.2	
38	In quick sort ,we partition the given array into two sub arrays based on the	C213.2	BIL1
	value stored in the element called pivot		
30	What is decrease-and-conquer technique?	C213.2	BTL1
39	The decrease-and-conquer technique is based on exploiting the relationship		

	between a solution to a given instance of a problem and solution to a smaller instance of the same problem.		
40	What are the three major variations of the decrease-and-conquer technique? The three major variations of the decrease-and-conquer technique are Decrease by a constant decrease by a constant factor variable size decrease	C213.2	BTL1
41	What is heap sort ? The heapsort algorithm involves preparing the list by first turning it into a max heap. The algorithm then repeatedly swaps the first value of the list with the last value, decreasing the range of values considered in the heap operation by one, and sifting the new first value into its position in the heap. This repeats until the range of considered values is one value in length.	C213.2	BTL1
42	 Write Closest Pair of Points algorithm using Divide and Conquer. 1) Find the middle point in the sorted array, we cantakeP[n/2] as middle point. 2) Divide the given array in two halves 3) Recursively find the smallest distances in both subarrays 4) From above 3 steps, we have an upper bound d of minimum distance 5) Sort the array strip[] according to y coordinates. 	C213.2	BTL1
43	What is meant by string-searching algorithms? String-searching algorithms sometimes called string-matching algorithms, are an important class of string algorithms that try to find a place where one or several strings (also called patterns) are found within a larger string or text.	C213.2	BTL1
44	Write the efficiency of heap sort algorithm. Heap sort is an in-place algorithm. Time Complexity: Time complexity of heapify is O(Logn). Time complexity of createAndBuildHeap() is O(n) and overall time complexity of Heap Sort is O(nLogn)	C213.2	BTL1
45	Write heap sort algorithmThe steps are:Call the buildMaxHeap() function on the list. Also referred to as heapify(),this builds a heap from a list in O(n) operations.Swap the first element of the list with the final element. Decrease theconsidered range of the list by one.Call the siftDown() function on the list to sift the new first element to itsappropriate index in the heap.Go to step (2) unless the considered range of the list is one element.	C213.2	BTL1
46	Write the selection sort algorithm The selection sort algorithm sorts an array by repeatedly finding the minimum element (considering ascending order) from unsorted part and putting it at the beginning. The algorithm maintains two sub arrays in a given array.	C213.2	BTL1

	 The subarray which is already sorted. Remaining subarray which is unsorted. In every iteration of selection sort, the minimum element (considering ascending order) from the unsorted subarray is picked and moved to the sorted subarray. 		
47	What is the efficiency of selection sort O(n2) time complexity	C213.2	BTL1
48	Write the bubble sort algorithm Bubble sort, sometimes referred to as sinking sort, is a simple sorting algorithm that repeatedly steps through the list, compares adjacent pairs and swaps them if they are in the wrong order. The pass through the list is repeated until the list is sorted. The algorithm, which is a comparison sort, is named for the way smaller or larger elements "bubble" to the top of the list.	C213.2	BTL1
49	What is the efficiency of bubble sort? Bubble sort has a worst-case and average complexity of O(n2), where n is the number of items being sorted.	C213.2	BTL1
50	Define control abstraction. A control abstraction we mean a procedure whose flow of control is clear but whose primary operations are by other procedures whose precise meanings are left undefined.	C213.2	BTL1

Q. NO.	QUESTIONS	СО	BLO OM'S LEVE L
1	Explain closest pair Problems by Brute Force method. NOV/DEC2017Refer page no 127 in Anany Levitin	C213.2	BTL5
2	ExplainTravelingSalesmanProblembyBruteForcemethod.[MAY/JUNE 2016].NOV?DEC 2018Refer page no 137 in Anany Levitin	C213.2	BTL5
3	Explain Knapsack problem by Brute Force method. Refer page no 139 in Anany Levitin	C213.2	BTL5
4	 Explain Merge sort, and arrange the following numbers in increasing order using merge sort. (18, 29, 68, 32, 43,37, 87, 24, 47, 50), APR/MAY 2015, MAY/JUNE 2016 NOV/DEC 2017, APR/MAY 2018 Refer page no 148 in Anany Levitin 	C213.2	BTL5

	Write an algorithm for quick sort and write its time complexity with example list are 5, 3, 1, 9, 8, 2, 4, 7. (15)		
5	Explain Multiplication of Large integers And Strassen's Matrix multiplication. [<u>NOV/DEC 2015,MAY/JUNE 2016</u>] APR/MAY 2018 Refer page no 166in Anany Levitin	C213.2	BTL5
6	Explain Closest pair and Convex-Hull Problems by divide and Conquer method. <u>APR/MAY 2015</u> Refer page no 171 in Anany Levitin	C213.2	BTL1
7	A pair contains 2 numbers, and its second number is on the right side of the first one in an array. The difference of a pair is the minus result while subtracting the second number from the first one. Construct a function which gets the maximal difference of all pairs in an array (using Divide and Conquer Method). <u>[APR/MAY 2015]</u>	C213.2	BTL6
8	Explain the binary search algorithm with suitable example. <u>APRIL /</u> MAY 2017	C213.2	BTL5
9	Consider the problem of finding the smallest and largest elements in an array of N numbers. i)Design a presorting –based algorithm for solving this problem and determine its efficiency class. ii)Compare the efficiency of the three algorithms: (A)the brute –force algorithm.(B)this presorting based algorithm ,and (C)the Divide-and conquer algorithm.	C213.2	BTL6
10	Explain Assignment problem by Brute Force method.	C213.2	BTL1
11	Explain Quick sort and arrange the following numbers in increasing order using QUICK sort. (18, 29, 68, 32, 43,37, 87, 24, 47, 50), NOV/DEC 2017, APR/MAY 2018,NOV/DEC 2018	C213.2	BTL5
12	Write the algorithm for Computing a ⁿ	C213.2	BTL1
13	Explain String Matching algorithm in detail	C213.2	BTL1
14	Explain Convex-Hull Problems by Brute Force method. NOV/DEC 2017	C213.2	BTL1
15	Explain heap sort and arrange the following numbers in increasing order using heap sort. (18, 29, 68, 32, 43,37, 87, 24, 47, 50),	C213.2	BTL5

<u>UNIT III</u>

Q. No.	Questions	СО	Bloom' s Level
1	Explain principle of Optimality? NOV/DEC 2017 The principle of optimality says that an optimal solution to any instance of an optimization problem is composed of optimal solution to its sub-instances.	C213.3	BTL2
2	What is need for finding minimum spanning tree? Spanning tree has many applications. Any connected graphs with n vertices mush have at least n-1 edges and all connected graphs with n-1 edges are trees. If the nodes of G represent cities and edges represent possible communication links connecting 2 cities, then the minimum number of links needed to connect the n cities is n-1. Therefore, it is necessary for finding minimum spanning tree.	C213.3	BTL1
3	What is critical path? A path of longest length is called critical path. For example in tree	C213.3	BTL1
4	Define minimum Spanning Tree problem?APR/MAY 2018 A minimum spanning tree (MST) or minimum weight spanning tree is a subset of the edges of a connected, edge-weighted (un)directed graph that connects all the vertices together, without any cycles and with the minimum possible total edge weight.	C213.3	BTL1
5	What is Dynamic programming? Dynamic programming is an algorithm design technique for solving problem with overlapping subprograms. The smaller subprograms are solved only once and recording the results in a table from which the solution to the original problem is obtained	C213.3	BTL1
6	What is greedy method? <u>APRIL/MAY 2017</u> The greedy method is the most straight forward design, which is applied for change making problem. The greedy technique suggests constructing a solution to an optimization problem through a sequence of steps, each expanding a partially constructed solution obtained so far, until a complete solution to the problem is reached. On each step, the choice made must be feasible, locally optimal and irrevocable.	C213.3	BTL1
7	List the advantage of greedy algorithm a.Greedy algorithm produces a feasible solution b.Greedy method is very simple to solve a problem c.Greedy method provides an optimal solution directly.	C213.3	BTL4

8	List the applications of minimum Spanning tree are used to obtain an electric network. Another ap property that a spanning tree is V(G')=V(G) and G' is connected	an independent set of circuit equations for oplication of spanning tree arises from the s a minimal sub graph G' of G such that	C213.3	BTL4
9	What do you mean by row maj In a given matrix, the maximum major. In a given matrix, the maximum	jor and column major? elements in a particular row is called row elements in a particular column is called	C213.3	BTL1
	column major.	· · · · · · · · · · · · · · · · · · ·		
10	What is meant by feasible solu	tion?	C213.3	BTI 1
10	Given n inputs and we are requ some given constraints then such	ired to form a subset such that it satisfies a subset is called feasible solution.	0215.5	DILI
	Illustrate any two characterist	ics of Greedy Algorithm?		
	a) To solve a problem in given set of candidate	an optimal way construct the solution from es.	C212.2	
11	b) As the algorithm pr among this one set co considered and chose that have been considered	roceeds, two other sets get accumulated ntains the candidates that have been already n while the other set contains the candidates ered but rejected.	C213.5	BILZ
	Define optimal solution?	3	0212.2	DTI 4
12	A feasible solution either maximum function is called as optimal solution	nizes or minimizes the given objective ution.	C213.3	BIL1
13	What are the differences betw and conquer approaches?NO Divide and Conquer Divide and Conquer works by d conquer each sub-problem recur Dynamic Programming Dynamic Programming is a to overlapping sub problems. Each the result of each sub-proble implemented as an array or a h sub-solutions may be used to technique of storing the su memorization.	veen dynamic programming and divide V?DEC 2018 ividing the problem into sub-problems, sively and combine these solutions. technique for solving problems with a sub-problem is solved only once and em is stored in a table (generally pash table) for future references. These obtain the original solution and the ub-problem solutions is known as	C213.3	BTL1
	Compare Greedy method and	Dynamic programming.		
	Greedv method	Dynamic programming		
14	1.Only one sequence of decision is generated.	1.Many number of decisions are generated.	C213.3	BTL5
	2.It does not guarantee to give an optimal solution always.	2.It definitely gives an optimal solution always.		

15	List the features of dynamic programming? Optimal solutions to sub problems are retained so as to avoid recomputing their values. Decision sequences containing subsequences that are sub optimal are not considered. It definitely gives the optimal solution always.	C213.3	BTL4
16	What are the drawbacks of dynamic programming? Time and space requirements are high, since storage is needed for all level. Optimality should be checked at all levels.	C213.3	BTL1
17	 Show the general procedure of dynamic programming. <u>APRIL/MAY</u> 2017 The development of dynamic programming algorithm can be broken into a sequence of 4 steps. Characterize the structure of an optimal solution. Recursively define the value of the optimal solution. Compute the value of an optimal solution in the bottom-up fashion. Construct an optimal solution from the computed information 	C213.3	BTL2
18	How dynamic programming is used to solve Knapsack problem.NOV?DEC 2018 An example of dynamic programming is Knapsack problem. The solution to the Knapsack problem can be viewed as a result of sequence of decisions. We have to decide the value of xi for $1 < i \le n$. First we make a decision on x1 and then on x2 and so on. An optimal sequence of decisions maximizes the object function $\Sigma p_i x_i$.	C213.3	BTL2
19	Define warshall's algorithm? Warshall's algorithm is an application of dynamic programming technique, which is used to find the transitive closure of a directed graph.	C213.3	BTL1
20	What does Floyd's algorithm do? NOV/DEC 2017 Floyd's algorithm is an application, which is used to find the entire pairs shortest paths problem. Floyd's algorithm is applicable to both directed and undirected weighted graph, but they do not contain a cycle of a negative length.	C213.3	BTL1
21	Define prim's algorithm. Prim's algorithm is a greedy and efficient algorithm, which is used to find the minimum spanning tree of a weighted connected graph.	C213.3	BTL1
22	How efficient is prim's algorithm? The efficiency of the prim's algorithm depends on data structure chosen for the graph.	C213.3	BTL1
23	Define kruskal's algorithm?kruskal's algorithm is another greedy algorithm for the minimum spanning tree problem.kruskal's algorithm constructs a minimum spanning tree by selecting edges in increasing order of their weights provided that the inclusion does not create a cycle. kruskals algorithm provides a optimal solution.	C213.3	BTL1

	What is path compression?		
24	The better efficiency can be obtained by combining either variation of quick union with path compression. Path compression makes every node encountered during the execution of a find operation point to the tree's node.	C213.3	BTL1
	Define Dijkstra's Algorithm?		
25	Dijkstra's algorithm solves the single source shortest path problem of finding shortest paths from a given vertex(the source), to all the other vertices of a weighted graph or digraph. Dijkstra's algorithm provides a correct solution for a graph with non negative weights.	C213.3	BTL1
	What is Huffman trees?		
26	A Huffman tree is binary tree that minimizes the weighted path length from the root to the leaves containing a set of predefined weights. The most important application of Huffman trees are Huffman code		BTL1
	What do you mean by Huffman code?		
27	A Huffman code is a optimal prefix tree variable length encoding scheme that assigns bit strings to characters based on their frequencies in a given text.	C213.3	BTL1
	What is meant by compression ratio?		
28	Huffman's code achieves the compression ratio, which is a standard measure of compression algorithm's effectiveness of (3-2.25)/3*100 = 0.75/3*100 = 0.25*100 = 250'	C213.3	BTL1
	- 2370. List the advantage of Huffman's encoding?		
29	 a. Huffman's encoding is one of the most important file compression methods. b. It is simple c. It is versatility d. It provides optimal and minimum length encoding 	C213.3	BTL4
	Define the single source shortest path problem. <u>MAY/JUNE 2016</u>]		
30	Single source shortest path problem can be used to find the shortest path from single source to all other vertices. Example:Dijikstras algorithm	C213.3	BTL1
	List out the memory functions used under dynamic programming.	C212.2	
31	[MAY/JUNE 2015]	C215.5	DIL4
	Refer notes		
32	Define transitive closure of a directed graph.APR/MAY 2018 Given a directed graph , find out if a vertex j is reachable from another vertex i for all vertex pairs (i, j) in the given graph . Here reachable mean that there is a path from vertex i to j. The reach-ability matrix is called transitive closure of a graph .	C213.3	BTL1
	What is meant by coin changing problem	C212.2	
33	Given a set of coins and amount, Write an algorithm to find out how many ways we can make the change of the amount using the coins given.	C213.3	BILT

34	Write the method for Computing a Binomial Coefficient Computing binomial coefficients is non optimization problem but can be solved using dynamic programming. Binomial coefficients are represented by $C(n, k)$ or (nk) and can be used to represent the coefficients of a binomial: (a + b)n = C(n, 0)an + + C(n, k)an-kbk + + C(n, n)bn The recursive relation is defined by the prior power C(n, k) = C(n-1, k-1) + C(n-1, k) for $n > k > 0IC C(n, 0) = C(n, n) = 1$	C213.3	BTL1
35	Define multistage graph.NOV/DEC 2018 A Multistage graph is a directed graph in which the nodes can be divided into a set of stages such that all edges are from a stage to next stage only (In other words there is no edge between vertices of same stage and from a vertex of current stage to previous stage).	C213.3	BTL1
36	Define Container Loading Problem The basic Container Loading Problem can be defined as the problem of placing a set of boxes into the container respecting the geometric constraints: the boxes cannot overlap and cannot exceed the dimensions of the container.	C213.3	BTL1
37	What is meant by Optimal merge pattern Optimal merge pattern is a pattern that relates to the merging of two or more sorted files in a single sorted file. This type of merging can be done by the two-way merging method.	C213.3	BTL1
38	Write Optimal merge pattern algorithm Least (L): find a tree in L whose root has the smallest weight. Function : Tree (L,n). Integer i; Begin For i=1 to n -1 do Get node (T) /* create a node pointed by T */ Left child (T)= Least (L) /* first smallest */ Right child (T)= Least (L) /* second smallest */ Weight (T) = weight (left child (T)) + weight (right child (T)) Insert (L,T); /* insert new tree with root T in L */ End for Return (Least (L)) /* tree left in L */ End.	C213.3	BTL1
39	Write the time complexity of optimal merge pattern algorithm If we have two sorted files containing n and m records respectively then they could be merged together, to obtain one sorted file in time O (n+m).	C213.3	BTL1
40	Write the Algorithm for building a Huffman coding tree. make a list of all symbols with their frequencies	C213.3	BTL1

	sort the list so the symbols with the least frequency are in front		
	if the list only has one element, the element is the root of the tree and we are		
	done		
	remove the first two elements from the list and put them into a binary tree		
	add the frequencies of the two sub trees to give the frequency of this binary		
	tree		
	insert this tree in the right place in the sorted list		
	return to step 3		
	Define 0/1 Knapsack problem.		
	The solution to the Knapsack problem can be viewed as a result of sequence		
41	of decisions. We have to decide the value of xi. xi is restricted to have the	C213.3	BTL1
41	value 0 or 1 and by using the function knap(l, j, y) we can represent the		
	problem as maximum Σpi xi subject to Σwi xi < y where 1 - iteration, j -		
	number of objects, y – capacity.		
	What is the formula to calculate optimal solution in 0/1 Knapsack	~ ~ ~ ~ ~	
42	problem?	C213.3	BTL1
	The formula to calculate optimal solution is		
	g0(m)=max{g1, g1(m-w1)+p1}.		
	Pouting a postal yap to pickup mail from hoves located at n different sites

<u>UNIT IV</u>

<u>PART – A</u>

Q. No.	Questions	со	Bloom's Level
1	What is iterative improvement method? This is a computational technique in which with the help of initial feasible solution the optimal solution is obtained iteratively until no improvement is found.	C213.4	BTL1
2	List various applications of iterative improvement method. 1.Simplex method 2.Matching graph vertices 3.Stable marriage problem 4.Finding maximum network flow.	C213.4	BTL4
3	What is Simplex Method? The Simplex Method is "a systematic procedure for generating and testing candidate vertex solutions to a linear program." It begins at an arbitrary corner of the solution set. At each iteration, the Simplex Method selects the variable that will produce the largest change towards the minimum (or maximum) solution. That variable replaces one of its compatriots that is most severely restricting it, thus moving the Simplex Method to a different corner of the solution set and closer to the final solution. In addition, the Simplex Method can determine if no solution actually exists.	C213.4	BTL1
4	 How Iterative improvement solves problems.NOV/DEC 18 Iterative improvement solves problems where: The problem is an optimization problem, to find the solution that minimizes or maximizes some value (cost/profit). An initial solution can be easily found. It can be improved by a sequence of small changes. It is returned when no more improvements can be made. 	C213.4	BTL1
5	What is linear programming problem?The standard form of linear programming isP=ax+by+czLP problem is a problem in which we have to find the maximum orminimum value of a linear objective function.	C213.4	BTL1
6	What is meant by Bipartite Graph? NOV/DEC 2017 A Bipartite Graph $G = (V;E)$ is a graph in which the vertex set V can be divided into two disjoint subsets X and Y such that every edge $e \in E$ has one end point in X and the other end point in Y .A matching M is a subset of edges such that each node in V appears in at most one edge in M.	C213.4	BTL1

	What is two colorable graph?		
7	It is a graph that can be colored with only two colors in such a way that no	C213.4	BTL1
/	edge connects the same color. The bipartite graph is two colorable graph.		
	What is maximum cardinality matching?APR/MAY 2018		
0	A maximum matching (also known as maximum-cardinality matching)	C213.4	BTI 1
8	is a matching that contains the largest possible number of edges. There may	0_1011	0.111
	be many maximum matchings. The matching number of a graph is the size of a maximum matching		
	Size of a maximum matching. What is moont by Movimum Matching?		
9	A maximum matching is a matching with the largest possible number of	C213.4	BTL1
	edges: it is globally ontimal		
	What is network?		
10	A flow network $G=(V,E)$ is a directed graph in which each edge $(u,v) \notin E$	C213.4	BTL1
_	has a nonnegative capacity $c(u,v) \ge 0$.		
	Define Maximum Flow Theorem.	C213.4	BTL1
11	A flow has maximum value if and only if it has no augmenting path.		
	What is Augmenting path in bipartite graph.?		
12	The Augmenting path P is a path in Graph G, such that it is an alternating	C213.4	BTL1
12	path with special property that-Its start and end vertices are free or		
	unmatched.		
	When can we say that the optimal solution is obtained in simplex		
13	method?	C213.4	BTL1
15	When objective function (ie value of z) is largest then the optimal solution		
	is said to be obtained in simplex method.		
	What is entering variable?	C213.4	BTI 1
14	The entering variable is the smallest negative entry in the bottommost row	021011	DILL
	of simplex table.		
15	What is pivot element in simplex method?	C213.4	BTL1
15	The intersection of entering variable's column and departing variable's row		
	Is called pivot.		
	The stable marriage problem (SMP) is the problem of finding a stable		
	matching between two sets of elements given a set of preferences for each	C213.4	
16	element A matching is a mapping from the elements of one set to the	C213.4	DILZ
	elements of the other set		
	cientents of the other set.		
	Explain Stable marriage problem algorithm.		
	Input: A set of n men and a set of n women along with rankings of the		
	women by each man and rankings of the men by each woman with no ties		
	allowed in the rankings	C212 4	
17	Output: A stable marriage matching.	C215.4	BIL2
	Step 0 :Start with all the men and women being free.		
	Step 1 :While there are free men, arbitrarily select one of them and do the		
	following:		
	Proposal: The selected free man <i>m</i> proposes to <i>w</i> , the next woman		

	on his preference list (who is the highest-ranked woman who has not		
	rejected him before).		
	Response: If w is free, she accepts the proposal to be matched with m.		
	If she is not free, she compares m with her current mate. If she prefers m to		
	him, she accepts <i>m</i> 's proposal, making her former mate free; otherwise, she		
	simply rejects <i>m</i> 's proposal, leaving <i>m</i> free.		
	Step 2 Return the set of <i>n</i> matched pairs		
	when we can tell that the matching is stable in SMP?		
	A matching is stable whenever it is <i>not</i> the case that both:	C212.4	
18	a. some given element A of the instanced set prefers some given	C213.4	BIL1
	element B of the second matched set over the element to which A is		
	h = R also prefers A over the element to which R is already metabod		
	<i>b. B</i> also prefers <i>A</i> over the element to which <i>B</i> is already matched.		
	Snow the requirements of the standard form in simplex method.		
	• It must be a maximization problem.	C212.4	
19	• All the constraints (except the nonnegativity constraints) must be in	C215.4	BILZ
	the form		
	• of linear equations with nonnegative right-hand sides.		
	How to find the ontoring variable in simpley method		
	Select a negative entry from among the first <i>n</i> elements of the objective row		
20	(A commonly used rule is to select the negative entry with the largest	C213.4	BTL1
20	absolute value with ties broken arbitrarily) Mark its column to indicate the		
	entering variable and the pivot column.		
	How to find the departing variable in simplex method.		
	For each positive entry in the pivot column, calculate the θ -ratio by dividing		
	that row's entry in the rightmost column by its entry in the pivot column. (If	~ ~ ~ ~ ~	
21	all the entries in the pivot column are negative or zero, the problem is	C213.4	BTL1
	unbounded—stop.) .Find the row with the smallest θ -ratio (ties may be		
	broken arbitrarily), and mark this row to indicate the departing variable and		
	the pivot row.		
	What is flow network.		
	It contains exactly one vertex with no entering edges; this vertex is called		
	the <i>source</i> and assumed to be numbered 1. It contains exactly one vertex		
	with no leaving edges; this vertex is called the <i>sink</i> and assumed to be	C212.4	
22	numbered n . The weight <i>uij</i> of each directed edge (i, j) is a positive integer,	C215.4	BILT
	called the edge <i>capacity</i> . (This number represents the upper bound on the		
	amount of the material that can be sent from <i>i</i> to <i>j</i> through a link represented		
	by this edge.) .A digraph satisfying these properties is called a <i>flow network</i>		
	or simply a <i>network</i> .		
	What is a cuts in flow networks. [APR/MAY 2015]	C213.4	RTI 1
23	Cut is a collection of arcs such that if they are removed there is no path	C213.4	DILL
	from source to sink		
24	What is meant by flow-conservation requirement	C213.4	BTL1
<u>_</u>	It is assumed that the source and the sink are the only source and destination		

	of the material, respectively; all the other vertices can serve only as points		
	where a flow can be redirected without consuming or adding any amount of		
	the material. In other words, the total amount of the material entering an		
	intermediate vertex must be equal to the total amount of the material leaving		
	the vertex. This condition is called the <i>flow-conservation requirement</i> .		
	Define Max-Flow Min-Cut Theorem.	C213 /	DTI 1
25	The value of a maximum flow in a network is equal to the capacity of its	C213.4	DILI
	minimum cut.		
26	What is a state space graph?[MAY/JUNE 2016]	C213.4	BTL1
20	Graph organization of the solution space is state space tree.		
	Define slack variable.	C212.4	
27	Variables transforming inequality constraints into equality constraints are	C213.4	BIL1
	called slack variables.		
	Define extreme point theorem. NOV/DEC 2017		
	Any LP problem with a non empty bounded feasible region has an optimal		
20	solution; moreover, an optimal solution can always be found at an extreme	C213.4	BTL1
28	point of the problems feasible region. This theorem implies that to solve a		
	linear programming problem, at least in the case of a bounded feasible		
	region, we can ignore all but a finite number of points in its feasible region.		
	What do you mean by perfect matching in Bipartite graph?		
	APRIL/MAY 2017		
	A perfect matching of a graph is a matching (i.e., an independent edge set)		
29	in which every vertex of the graph is incident to exactly one edge of the	C213.4	BTL1
_>	matching. A perfect matching is therefore a matching containing $n/2$ edges		
	(the largest possible) meaning perfect matching are only possible on graphs		
	with an even number of vertices		
	Explain Planar colouring granh problem APRIL/MAY 2017		
	Δ graph is planar if it can be drawn in a plane without edge-crossings. The		
	four color theorem states that any planar man can be colored with at most	C212 4	ר ודם
30	four colors. In graph terminology, this means that using at most four colors	C215.4	DILZ
	any planar graph can have its nodes colored such that no two adjacent nodes		
	have the same color		
	What is an articulation point in a graph? APP/MAV 2017		
	A vertex in an undirected connected graph is an articulation point (or out	C212 4	
31	A vertex in an ununected connected graph is an articulation point of cut vertex) iff removing it (and address through it) disconnects the graph. It can	C215.4	BILI
	he thought of as a single point of failure		
	User is a finance station in the second second dependence of the second se		
	How is a transportation network represented: APK/MAY 2018		
	Transportation networks generally refer to a set of links, nodes, and lines	C212.4	
32	that represent the infrastructure of supply side of the transportation. The	C215.4	BILI
	miss have characteristics such as speed and capacity for roadways,		
	the transit system		
	What is Solution Success 2Cine An Example NOV/DEC 19		
22	vy nat is Solution Space (Give An Example NOV/DEC 18	C213.4	BTL1
55	In mathematical optimization, a reasible region, reasible set, search space,		
1	or solution space is the set of all possible points (sets of values of the choice		

	variables) of an optimization problem that satisfy the problem's constraints, potentially including inequalities, equalities, and integer constraints.		
	In linear programming problems, the feasible set is a convex polytope		
34	 Write the requirements of linear programming problem standard form 1. It must be a maximization problem. 2. All the constraints (except the nonnegative constraints) must be in the form of linear equations with nonnegative right hand sides. 3. All the variables must be required to be nonnegative. 	C213.4	BTL1
35	Standard form of linear programming problem Maximize c1x1++cnxn// Objective function Subject to a _{i1} x ₁ ++a _{in} x _n =b _i _{xi} >=0	C213.4	BTL1
36	Write the optimality test in simplex method. If all the entries in the objective row except the one in the rightmost column, which represents the value of the objective function are non negative then stop.	C213.4	BTL1
37	How to form the next table in the simple method. Divide all the entries in the pivot row by its entry in the pivot column. Subtract from each of the other rows including the objective row ,the new pivot row multiplied by the entry in the pivot column of the row in question	C213.4	BTL1
38	What is matching in bipartite graph. A matching in a graph is a subset of its edges with the property that no two edges share a vertex.	C213.4	BTL1
39	What is free vertex in bipartite graph? A vertex is set to be a free vertex if no edge from matching M is incident to V.ie if v is not matched	C213.4	BTL1
40	Define source node. Vertex with no entering edges is called the <i>source</i> and assumed to be numbered 1.	C213.4	BTL1
41	Define sink node . Vertex with no leaving edges is called the <i>sink</i> and assumed to be numbered n .	C213.4	BTL1
42	What is edge capacity? The weight uij of each directed edge (i, j) is a positive integer, called the edge <i>capacity</i> .	C213.4	BTL1
43	What is meant by feasible flow in maximum flow problem. It is an assignment of real numbers Xij to edges i.j of a network that satisfy flow conservation constraints and the capacity constraints.	C213.4	BTL1
44	Write the three important things in Ford-Fulkereson method. 1.Residual network 2.Augmenting path 3.Cuts	C213.4	BTL1

45	What is Augmenting path in maximum flow problem.? The path which never violates the capacity constraints is called Augmenting path in maximum flow problem	C213.4	BTL1
46	What is residual network? A representation of a network with flow and capacity value for every node is called residual network.	C213.4	BTL1
47	What is forward edge in maximum flow problem. It is connected by a directed edge with some positive unused capacity so that we can increase the flow through that edge .	C213.4	BTL1
48	Define st-cut An st-cut is a cut that places s in one of its sets (Cs) and t in the other (Ct).	C213.4	BTL1
49	Write the Maxflow / mincut applications Data mining. • Open-pit mining. • Project selection. • Image processing. • Airline scheduling. • Bipartite matching.	C213.4	BTL1
50	 Write Ford-Fulkerson algorithm Generic method for solving maxflow problem. Start with 0 flow everywhere. Find an augmenting path. Increase the flow on that path, by as much as possible. Repeat until no augmenting paths are left. 	C213.4	BTL1

	What is the formula to calculate optimal solution in 0/1 Knapsack		
2	The formula to calculate optimal solution is	C213.5	BTL1
	$g_0(m)=\max\{g_1, g_1(m-w_1)+p_1\}.$		
	Illustrate traveling salesperson problem.		
3	Let $g = (V, E)$ be a directed. The tour of G is a directed simple cycle that includes every vertex in V. The cost of a tour is the sum of the cost of the edges on the tour. The traveling salesperson problem to find a tour of minimum cost.	C213.5	BTL2
	List some applications of traveling salesperson problem.		
4	Routing a postal van to pick up mail from boxes located at n different sites.	C213 5	BTI /
	Using a robot arm to tighten the nuts on some piece of machinery on	C215.5	DTL4
	an assembly line. Production environment in which several		
	commodules are manufactured on the same set of machines		

	Show the time complexity and space complexity of traveling salesperson		
5	problem.	C213 5	ר ודם
	Time complexity is $O(n^2 2^n)$.	C215.5	DILZ
	Space complexity is $O(n 2^n)$		
	Summarize the requirements that are needed for performing		
	Backtracking?		
6	 i. To solve any problem using backtracking, it requires that all the solutions satisfy a complex set of constraints. ii. They are: Explicit constraints. Implicit constraints 	C213.5	BTL2
	Define explicit constraint.		
7	They are rules that restrict each x_i to take on values only from a give set. They depend on the particular instance I of the problem being solved. All tuples that satisfy the explicit constraints define a possible solution space.	C213.5	BTL1
	Define implicit constraint.		
8	They are rules that determine which of the tuples in the solution space of I	C213.5	BTL1
0	satisfy the criteria function. It describes the way in which the x_i must relate		
	to each other.		
9	All the paths from the root of the organization tree to all the nodes is called	C213.5	BTL1
	as state space of the problem		
10	What are static trees?	C212.5	
	The tree organizations that are independent of the problem instance being	C215.5	BILI
	solved are called as static tree.		
11	What are dynamic trees?	C213.5	BTL1
	The tree organizations those are independent of the problem instance being		
	Solved are called as static free.		
12	A node which has been generated and all of whose children have not yet	C213.5	BTL1
	been generated is called as a live node		
13	Define a E – node.	C212.5	1 ודח
	E - node (or) node being expanded. Any live node whose children are	C215.5	BILL
	currently being generated is called as a $E - node$.		
14	Define a dead node.	C213.5	BTL1
	all of whose children have been generated		
15	List the factors that influence the efficiency of the backtracking		
	algorithm?		
	The efficiency of the backtracking algorithm depends on the following four	C213 5	RTI 4
	factors. They are: \bigcirc The time needed to generate the next x _{DT}	0213.3	DILT
	• The number of x_k satisfying the explicit constraints.		
	 The time for the bounding functions B_k The number of x_k satisfying the B_k 		

	Define Branch-and-Bound method.		
16	The term Branch-and-Bound refers to all the state space methods in which	C213.5	BTL1
	all children of the E-node are generated before any other live node can		
	become the E- node.		
	Define backtracking?		
17	Depth first node generation with bounding function is called backtracking.	C213.5	BTL1
1/	The backtracking algorithm has its virtue the ability to yield the answer with		
	far fewer than m trials.		
	What is Hamiltonian cycle in an undirected graph? [APR/MAY 2015]	C212.5	
18	A Hamiltonian cycle is round trip along n edges of G that visits every vertex	C215.5	BILT
	once and returns to its starting position.		
	What is Feasible solution?		
10	It is obtained from given n inputs	C213.5	BTL1
19	Subsets that satisfies some constraints are called feasible solution.		
	It is obtained based on some constraints		
	What is optimal solution?		
	It is obtained from feasible solution.	C213 5	DTI 1
20	Feasible solution that maximizes or minimizes a given objective	C215.5	DILI
	function		
	It is obtained based on objective function		
21	List the application of backtracking technique?	C213.5	BTL4
	The application of backtracking technique is 8-Queens problem		
	Show the application for Knapsack problem?		
22	The Knapsack problem is problem in combinatorial optimization. It	C212 5	
	derives its name from the maximum problem of choosing possible	C213.5	BTL2
	essential that can fit into one bag to be carried on a trip. A similar problem		
	very often appears in business, combinatory, complexity theory,		
	Define subset sum problem?		
	Define subset sum problem:	C212.5	
23	Subset sum problem is a problem, which is used to find a subset of a given set $S = (S_1, S_2, S_3, S_2)$ of a problem integers whose sum is equal to	C215.5	BILI
	given positive integer d		
	What is houristic?		
24	A bauristic is a common sense rule drawn from experience rather than		
	from a mathematically proved assertion	C213.5	BTL1
	For example, going to the nearest un visited city in the travelling salesman		
	problem is good example for heuristic		
	What is promising and non promising node? NOV/DEC 2017		
25	A node in a state space tree is said to be promising if it corresponds to a	C213.5	BTL1
	partially constructed solution that may still lead to a complete solution.		
	Otherwise, a node is called non- promising.		
	What are the additional items are required for branch and bound		
26	compare to backtracking technique?	C213 5	
	Compared to backtracking, branch and bound requires 2 additional items.	C213.J	DILI
	1) A way to provide, for every node of a node of a state space tree, a		
	bound on the best value of the objective function on any solution that can		

	be obtained by adding further components to the partial solution		
	represented by the node.		
	2) The value of the best solution seen so far.		
	Compare backtracking and branch bound techniques.		
27	Backtracking is applicable only to non optimization problems.	C213.5	BTL2
	Backtracking generates state space tree in depth first manner.	021010	
	Branch and bound is applicable only to optimization problem.		
	Branch and bound generated a node of state space tree using best first rule.		
	Branch-and-Bound method.		
28	The searching techniques that are commonly used in Branch-and-Bound	C213.5	BTL1
20	method are:		
	i. FIFO ii. LIFO iii. LC iv. Heuristic search		
	Illustrate 8 – Queens problem.		
29	The problem is to place eight queens on a 8 x 8 chessboard so that no two	C213.5	BTL2
_>	queen "attack" that is, so that no two of them are on the same row, column		
	or on the diagonal. Show the purpose of lower bound [MAV/IIINE 2016]		
30	Lower bound of a problem is an estimate on a minimum amount of work	C213.5	BTL2
50	needed to solve a given problem.		
	Compare NP- hard and Np-complete problems? [APR/MAY 2015]	C212.5	ר ודם
31	The problems whose solutions have computing times are bounded by	C215.5	BILZ
	polynomials of small degree.		
	Define P and NP problem. APR/MAY 2017, NOV/DEC 18 In computational complexity theory, P , also known as PTIME or DTIME(n), is a fundamental complexity class. It contains all decision problems that can be solved by a deterministic Turing machine using a polynomial amount of computation time, or polynomial time.		
32	<u>NP</u> : the class of decision problems that are solvable in polynomial time. <u>NP</u> : the class of decision problems that are solvable in polynomial time on a <i>nondeterministic</i> machine (or with a nondeterministic algorithm).(A <u>deterministic</u> computer is what we know).A <u>nondeterministic</u> computer is one that can "guess" the right answer or solution think of a nondeterministic computer as a parallel machine that can freely spawn an infinite number of processes	C213.5	BTL1
33	Feasible solution means set which contains all the possible solution which follow all the constraints		
	An optimal solution is a feasible solution where the objective function	C213.5	BTL1
	reaches its maximum (or minimum) value – for example, the most profit or		
	the least cost. A globally optimal solution is one where there are no other		
	feasible solutions with better objective function values		
34	How is lower bound found by problem reduction? APR/MAY2018		
	It problem P is at least as hard as problem Q, then a lower bound for Q is also a lower bound for P. Hence, find problem Q with a known lower bound	C213 5	0 דו
	that can be reduced to problem P in question, then any algorithm that solves	C213.J	DILL
	P will also solve Q		
35	What are tractable and non tractable problems ?APR?MAY 2018 Problems that are solvable by polynomial time algorithms as	C213.5	BTL1

what is a 'hard' problem is a fine one C213.5 BTI 36 The tree organization of the solution space is referred to as state space tree C213.5 BTI 37 Any problem for which the answer is either zero or one is called decision problem. C213.5 BTI 38 A maxclique problem? An maxclique problem? C213.5 BTI 38 A maxclique problem? Q. NO.	QUESTIONS	со	BLOOM'S LEVEL
1	Explain how the branch and bound technique is used to solve Knapsack problem (OR) Implement an algorithm for Knapsack problem using NP-Hard Approach. [APRIL/MAY 2010. APR/MAY 2015] Refer page no 404 in Anany Levitin	C213.5	BTL5
2	Explain NP-hard and NP-completeness. [<u>APRIL/MAY 2011]</u> Refer page no 369 in Anany Levitin	C213.5	BTL5
3	Discuss the backtracking solution to solve 8-Queens problem, <u>APR/MAY 2017</u> Refer page no 393 in Anany Levitin	C213.5	BTL6
4	What is Hamiltonian problem? Explain with an example using backtracking? NOV/DEC 2017 Refer page no 395 in Anany Levitin	C213.5	BTL5
5	Apply Branch and Bound Technique to solve travelling salesperson problem. Refer page no 406 in Anany Levitin	C213.5	BTL3
6	Apply Branch and Bound Technique to solve Assignment problem. Explain how job assignment problem could be solved, given n tasBTLs and n agents where each agent has a cost to complete each tasBTL, using Branch and Bound technique. [APR/MAY 2015], NOV/DEC 2017	C213.5	BTL3

	Refer page no 402 in Anany Levitin		
7	Applyapproximationalgorithm(nearestneighbouralgorithm,multifrgment-heuristic algorithm)for travelling salespersonproblem.Assume that the cost function satisfies the triangleinequality.[APR/MAY 2015], APR/MAY 2018Refer Notes	C213.5	BTL3
8	State the subset-sum problem and complete state space tree of the backtracking algorithm applied to the instance A={3,5,6,7} and d=15 of the subset-sum problem. [MAY/JUNE 2016]	C213.5	BTL3
9	Apply branch and bound algorithm to solve the following travelling salesman problem. APR/MAY 2017,	C213.5	BTL6
10	Explain the methods for establishing lower bounds.NOV/DEC 2017	C213.5	BTL1
11	What is class NP? Discuss about any five problems for which no polynomial time algorithm has been found. APR/MAY 2018	C213.5	BTL
12	Discuss the approximation algorithm for NP hard problems. APR/ MAY 2017,NOV/DEC 2018	C213.5	BTL1
13	Write short notes on FIFO search	C213.5	BTL1
14	Explain in detail about LIFO Search	C213.5	BTL1
15	Consider the travelling salesperson instance defined by the following cost matrix ∞ 20 30 10 11 3 5 16 4 2 19 6 18 ∞ 3 16 4 7 16 ∞ Draw the state space tree and show the reduced matrices corresponding to each of the node. Nov/dec 2018	C213.5	BTL5
