

## ILLUSTRATIVE PROGRAMS

### Program to find Square root of a number

#### *Algorithm*

1. Start
2. Read n value
3. Call square root function
4. Assign  $\text{approx} = 0.5 * n$
5. Assign  $\text{better} = 0.5 * (\text{approx} + n/\text{approx})$
6. While  $\text{better} \neq \text{approx}$  assign better to approx
  - a.  $\text{Better} = 0.5 * (\text{approx} + n/\text{approx})$
7. Return the approx value
8. Stop

#### **Program**

```
def newtonSqrt(n):
    approx = 0.5 * n
    better = 0.5 * (approx + n/approx)
    while better != approx:
        approx = better
        better = 0.5 * (approx + n/approx)
    return approx
n=int(input("Enter the n value"))
print(newtonSqrt(n))
```

#### *Output*

Enter the n value

64

8

### Program to find GCD of 2 numbers

#### *Algorithm*

- 1) Start
- 2) Read 2 numbers n1, n2
- 3)  $\text{Rem} = n1 \% n2$
- 4) While  $\text{rem} \neq 0$

- 
- 5)  $n1 = n2$
  - 6)  $n2 = \text{rem}$
  - 7)  $\text{rem} = n1 \% n2$
  - 8) Print GCD is  $n2$
  - 9) Stop

### ***Program***

```
n1=int(input("Enter the first
number")) n2=int(input("Enter the
second number")) rem = n1 % n2
while rem != 0:
    n1
    =
    n2
    n2
    =
    rem
    rem = n1 % n2
print ("GCD of the numbers is :", n2)
```

### ***Output***

```
Enter the first number 10
Enter the second number 5
GCD of the numbers is 5
```

### **Program to find Exponentiation**

#### ***Algorithm***

- 1) Start
- 2)  $r = n$
- 3) Read base number  $n$
- 4) Read exponent number  $e$
- 5) For  $i = 1$  to  $e$
- 6) Compute  $r = n * r$
- 7) Print exponent  $r$

8) Stop

***Program***

```
n = int(input("Enter the number"))
e = int(input("Enter the exponent"))
r = n
for i in range (1,e):
    r = n*r
print("Exponentiation is", r)
```

***Output***

```
Enter the number
3
Enter the exponent
2
Exponentiation is
9
```

---

## Program to implement Linear Search

### *Algorithm*

- 1) Start
- 2) Read number of array elements n
- 3) Read array elements  $A_i$ ,  $i = 0, 1, 2, \dots, n-1$
- 4) Read search value
- 5) Assign false to flag
- 6) Check each array element against search
- 7) If element = list[i] then flag = true
- 8) Print "Element found"
- 9) Print position i
- 10) If flag = false then print "Element not found"
- 11) Stop

### **Program**

```
n=int(input("Enter the number of elements in the list"))
list=[]
flag=False
print("Enter the elements")
for i in range(0,n):
    list.append(int(input()))
print("The elements in the list are", list)
element=int(input("Enter the element to be searched"))
for i in range(0,n):
    if element==list[i]:
        flag=True
        break
if flag==True:
    print("Element", element, "was found at location", i+1)
else:
```

```
print("Element {} was not found", format(element))
```

***Output***

```
Enter the number of elements in the  
list : 6 Enter the elements in ascending  
order  
60  
40  
10  
20  
30  
50  
[60, 40, 10, 20, 30, 50]  
Enter the element to be searched 30  
Element 50 found at location 5
```
