

SNS COLLEGE OF ENGINEERING Kurumbapalayam (Po), Coimbatore – 641 107 DEPARTMENT OF ELECTRONICS AND COMMUNICATION ENGINEERING

# 19IT103 – COMPUTATIONAL THINKING AND PYTHON PROGRAMMING

\*A readable, dynamic, pleasant, flexible, fast and powerful language

#### **Recap:**

- Simple strategies for developing algorithms:
  - Iteration
  - Recursion

- Iteration: A sequence that is executed repeatedly so long as a certain condition holds. A sequence of statements is executed until a specified condition is true is called iterations.
  - for loop
  - While loop

#### Recap:

- Simple strategies for developing algorithms:
  - Iteration
  - Recursion

- Recursion: A function that calls itself is known as recursion.
- Recursion is a process by which a function calls itself repeatedly until some

specified condition has been satisfied.

#### **1.8 Illustrative problems:**

- Find a minimum in a list
- insert a card in a list of sorted cards

• To find the minimum element in the given list of elements.

Minimum Number In a List

## **Problem Statement:**

• The problem is to find the minimum element in the given list of elements. Finding minimum in a list of elements can be achieved in different ways.

#### Different ways to find minimum element in a list:

- One way is to sort the list of elements in ascending order and get the first element as minimum.
- Another method is to compare each element with other.
  - As an initial step, <u>first element of the list is considered as</u> minimum element.
  - And in each iteration, each element in the list is compared with the minimum.
  - If the element in the list is less than the minimum then swap both elements else compare with the next element in the list.
  - These steps are continued until the end of the list and finally print the minimum.

Find minimum of two numbers:

```
#find minimum of two numbers
# a and b are parameters''
def find min(a, b):
    if a < b:
        return a
    return b
print("Enter two values :")
a = int(input())
b = int(input())
print("Minimum number is ", find_min(a, b))
```

#### Find minimum of two numbers:

ma	in.py	Shell
1 -	<pre>def find_min(a,b):</pre>	Enter two values:
2 -	if(a <b):< td=""><td>5</td></b):<>	5
3	return a	88
4	return b	Minimum number is 5
5		>
6	<pre>print("Enter two values:")</pre>	
7	a=int(input())	
8	<pre>b=int(input())</pre>	
9	<pre>print("Minimum number is ",find_min(a,b))</pre>	
10		

#### Find minimum of three numbers:

```
#find minimum of three numbers
def find min(a, b):
    if a < b:
        return a
    return b
# a, b and c are parameters
def min of three(a, b, c):
    minVal = find_min(a, b)
    if c < minVal:</pre>
        return c
    return minVal
print("Enter three numbers: ")
a = int(input())
b = int(input())
c = int(input())
print("Minimum number is ", min_of_three(a, b, c))
```

#### Find minimum of three numbers:

main.p	ру	53 6	Run	Shell

17 pr:	<pre>int("Minimum of list is ", min_of_list(myList))</pre>	

## Insert a card in a list of sorted cards

Playing cards are one of the techniques of sorting and the steps are shown as follows:

- Start with an empty left hand and cards face down on the table.
- Then remove one card at a time from the table and Insert it into the correct position in the left hand.
- <u>To find a correct position for a card</u>, we compare it with each of the cards already in the hand from left to right.
- Once the position is found, the cards from that position are moved to the next higher indexed position and in that order.
- New card is inserted at the current position.

```
order = {
   'A': 1, '2': 2, '3': 3, '4': 4,
    '5': 5, '6': 6, '7': 7, '8': 8,
    '9': 9, '10': 10,
    'J': 11, '0': 12, 'K': 13
}
def insertCard(deck, newCard):
   for card in deck:
        if order[card] > order[newCard]:
           index = deck.index(card)
           deck.insert(index, newCard)
           break
    return deck
deck = ['2', '5', '8', '10', 'J', 'K'] # initial set of cards
print("deck = ", deck)
newCard = input("Enter the new card to be inserted:") # get the new card
insertCard(deck, newCard)
print(deck)
```

#### Output 1:

```
1 - order = {
                                                         deck = ['2', '5', '8', '10', 'J', 'K']
      'A': 1, '2': 2, '3': 3, '4': 4,
                                                          Enter the new card to be inserted:Q
 2
      '5': 5, '6': 6, '7': 7, '8': 8,
                                                          ['2', '5', '8', '10', 'J', '0', 'K']
 3
 4
      '9': 9, '10': 10,
                                                          >
 5
       'J': 11, '0': 12, 'K': 13
6 }
7
 8
9 - def insertCard(deck, newCard):
       for card in deck:
10 -
11 -
           if order[card] > order[newCard]:
               index = deck.index(card)
12
               deck.insert(index, newCard)
13
               break
14
       return deck
15
16
17
18 deck = ['2', '5', '8', '10', 'J', 'K'] # initial
       set of cards
19 print("deck = ", deck)
20 newCard = input("Enter the new card to be inserted
       :") # get the new card
```

## Output 2:

#### **Summary:**

## 1. Find a minimum in a list :

- One way is to sort the list of elements in ascending order and get the first element as minimum.
- Another method is to compare each element with other.
  - As an initial step, first element of the list is considered as minimum element.
  - And in each iteration, each element in the list is compared with the minimum.
  - If the element in the list is less than the minimum then swap both elements else compare with the next element in the list.
  - These steps are continued until the end of the list and finally print the minimum.

#### **Summary:**

- 2. insert a card in a list of sorted cards :
  - Start with an empty left hand and cards face down on the table.
  - Then remove one card at a time from the table and Insert it into the correct position in the left hand.
  - To find a correct position for a card, we compare it with each of the cards already in the hand from left to right.
  - Once the position is found, the cards from that position are moved to the next higher indexed position and in that order.
  - New card is inserted at the current position.
