Understanding Basics About Cloud Hosting Services Cloud Computing Services Cloud Computing What Is Cloud Computing

It compares deploying your web application in the cloud to an on-premises deployment presents an AWS Cloud architecture for hosting your application and.

fundamental part of the cloud. Large clouds predominant today often have functions distributed over multiple locations from central servers. Cloud migration is the process of moving data applications or other business elements to a cloud computing environment.

Cloud applications are web-enabled meaning instead of being based on physical hardware they are based in a shared virtual environment managed by a cloud-hosting provider. X dollars per month per user. CiteSeerX – Document Details Isaac Council Lee Giles Pradeep Teregowda.

Application access is independent of operating system. The sharing is performed between the host storage system and the remote storage system in a cloud computing environment. Software as a service SaaS is a cloud computing offering that provides users with access to a vendors cloud-based software.

Cloud and Hosted applications can either be traditional Windows applications accessed via technology such as Citrix or Terminal Services or an application that is HTML browser based. SaaS is almost always a pure WebHTML based solution and is almost always sold on a rental model typically. The sharing is performed between the host storage system and the remote storage system in a cloud computing environment. Can be used from any device.

SaaS also known as cloud-based software or cloud applications is application software that's hosted in the cloud and that you access and use via a web browser, a dedicated desktop client, or an API that integrates with your desktop or mobile operating system. Users do not install applications on their local devices.

Cloud computing and cloud services are often considered for both existing and new web application hosting environments. As a Software as a Service (SaaS) the cloud can offer healthcare organizations on-demand hosted services providing quick access to business applications and fulfilling customer relationship management (CRM). This is in part driven by the frequency that web applications are required.

Access to applications from anywhere. One common model is the transfer of data and applications from a local on-premises data center to the public cloud. However, a cloud migration could also entail moving data and applications from one cloud to another. TurboTax and even Facebook and Instagram are all cloud-based applications.

These solutions employ a cloud computing model to provide everything the developers need to do their work from hosted development environments and database tools to complete application management capabilities. This section helps you evaluate an

broke new ground by offering infrastructure on a utility model (billing by the hour). Developers, and startups finally had access to compute, storage, and eventually scalability. However, users are still locked into set pricing models and instance sizes. Without the ability to create flexible computing environments and scale vertically, more companies are shifting away from cloud computing 1.0 environments in favor of more flexible, modern infrastructures.

What Does it Mean for Application Development?

1

Access to familiar languages and tools

Since developers are most comfortable developing apps using languages that they are familiar with, the Google Cloud Platform allows them to choose the language of their choice - from Java, PHP, Node.js, Python, C#, .Net, Ruby etc. Access to a collection of tools & libraries that include Google Cloud SDK, Cloud Shell, Cloud Tools for Android Studio, IntelliJ, PowerShell, Visual Studio etc. make application development all the more efficient.

4

Being a fully-managed platform, Google Cloud Platform allows developers to quickly build and deploy applications and scale as required, and not worry about managing servers or configurations.

5

High Availability

The Google App Engine allows developers to build highly scalable applications on a fully managed serverless platform. All they have to do is simply upload their code and allow Google to manage the app's availability – without having to provision or maintain a single server.

In Depth Comparison Between Big Data And Cloud Computing

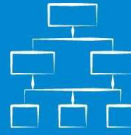

What is

Big Data ?

Big data is one of the most popular term these days. The name itself says that it contains the massive amount of data. Apart from containing the data it also provide the way to gathering, storing, organising and analysing data collected from various sources.

Structured

Structured data usually resides in relational databases (RDBMS). Fields store length-delimited data phone numbers, Social Security numbers, or ZIP codes.

Unstructured

Unstructured data is essentially everything else. Unstructured data has internal structure but is not structured via pre-defined data models or schema.

Cloud Computing

Cloud computing the name itself explaining what is it. It is the technology use for storing and access data and application through the internet. It is not similar to big data because you can't have your own personal resources for cloud computing.

Cloud Computing Category

1. SaaS(Software As A Service)

SaaS is one of the most famous cloud computing lots of companies are using SaaS to provide their service to the customers.

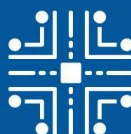

3. (PaaS) Platform as a Service

PaaS is one of the most popular cloud computing. It provide the platform to the users to develop the softwares through the tools provided by the PaaS company.

2.IaaS (Infrastructure as a Service)

In this type of cloud computing the companies provide the storage space on their computer to the users. The user get the specific amount of space as per company terms.

4. Let's Sum Up

Now we have taken a deep look on the characteristics of both cloud computing and big data. Big data is large set of data on the other hand cloud computing is all about giving the storage or accessing the large set of data over the internet.

Why Move To Cloud? Three Benefits Of Cloud Computing

01

Flexibility

First a company needs more bandwidth than usual, a cloud-based service can instantly meet the demand because of the vast capacity of the servers. In fact, this flexibility is so crucial that 65% of respondents to an InformationWeek survey said "the ability to quickly meet business demands" was an important reason to move to cloud computing.

02

Work from anywhere

As long as employees have internet access, they can work from anywhere. This flexibility positively affects knowledge workers' work-life balance and productivity. One study found that 42% of working adults would give up some of their salary if they could telecommute, and on average they would take a 6% paycut.

03

Environmentally friendly

Businesses using cloud computing only use the server space they need, which decreases their carbon footprint. Using the cloud results in at least 30% less energy consumption and carbon emissions than using on-site servers. And again, SMEs get the most benefit: for small companies, the cut in energy use and carbon emissions is likely to be 90%.

SCALABILITY

Your business can scale up or scale down your operation and storage needs quickly to suit your situation, allowing flexibility as your needs change. Rather than purchasing and installing expensive upgrades yourself, your cloud computer service provider can handle this for you.

LOWER OPERATING & MAINTENANCE COSTS

Moving to cloud computing may reduce the cost of managing and maintaining your IT systems. Rather than purchasing expensive systems and equipment for your business, you can reduce your costs by using the resources of your cloud computing service provider.

DISASTER RECOVERY

When companies start relying on cloud-based services, they no longer need complex disaster recovery plans. Cloud computing providers take care of most issues, and they do it faster.

IMPROVE ACCESSIBILITY

You have access anytime, anywhere, making your life so much easier!

QUICK DEPLOYMENT

Cloud computing gives you the advantage of quick deployment. Once you opt for this method of functioning, your entire system can be fully functional in a matter of a few minutes.

SECURITY

Some 800,000 laptops are lost each year in airports alone. This can have some serious monetary implications, but when everything is stored in the cloud, data can still be accessed no matter what happens to a machine.

AUTOMATIC SOFTWARE INTEGRATION

In the cloud, software integration is usually something that occurs automatically. This means that you do not need to take additional efforts to customize and integrate your applications as per your preferences.
