

Department of Artificial Intelligence & Data Science

# Cyber Security

---

Daze Thomas  
Assistant Professor | AI & DS

# Objectives for Chapter 2

- Survey authentication mechanisms
- List available access control implementation options
- Explain the problems encryption is designed to solve
- Understand the various categories of encryption tools as well as the strengths, weaknesses, and applications of each
- Learn about certificates and certificate authorities

# Authentication

- The act of proving that a user is who she says she is
- Methods:
  - Something the user *knows*
  - Something the user *is*
  - Something user *has*

# Something You Know

- Passwords
- Security questions
- Attacks on “something you know”:
  - Dictionary attacks
  - Inferring likely passwords/answers
  - Guessing
  - Defeating concealment
  - Exhaustive or brute-force attack
  - Rainbow tables

# Distribution of Password Types

# Password Storage

Identity	Password
Jane	qwerty
Pat	aaaaaa
Phillip	oct31witch
Roz	aaaaaa
Herman	guessme
Claire	aq3wm\$oto!4

**Plaintext**

Identity	Password
Jane	0x471aa2d2
Pat	0x13b9c32f
Phillip	0x01c142be
Roz	0x13b9c32f
Herman	0x5202aae2
Claire	0x488b8c27

**Concealed**

# Biometrics: Something You Are

# Problems with Biometrics

- Intrusive
- Expensive
- Single point of failure
- Sampling error
- False readings
- Speed
- Forgery

Recent advances in smartphones have begun to make biometrics cheaper and easier to use. Biometrics are still inadequate for extremely sensitive applications, but their convenience makes them a great alternative to weak passwords.

# Tokens: Something You Have

## Time-Based Token Authentication

Login: mcollings

Passcode: 2468159759

PASSCODE = PIN + TOKENCODE

Token code:  
Changes every  
60 seconds

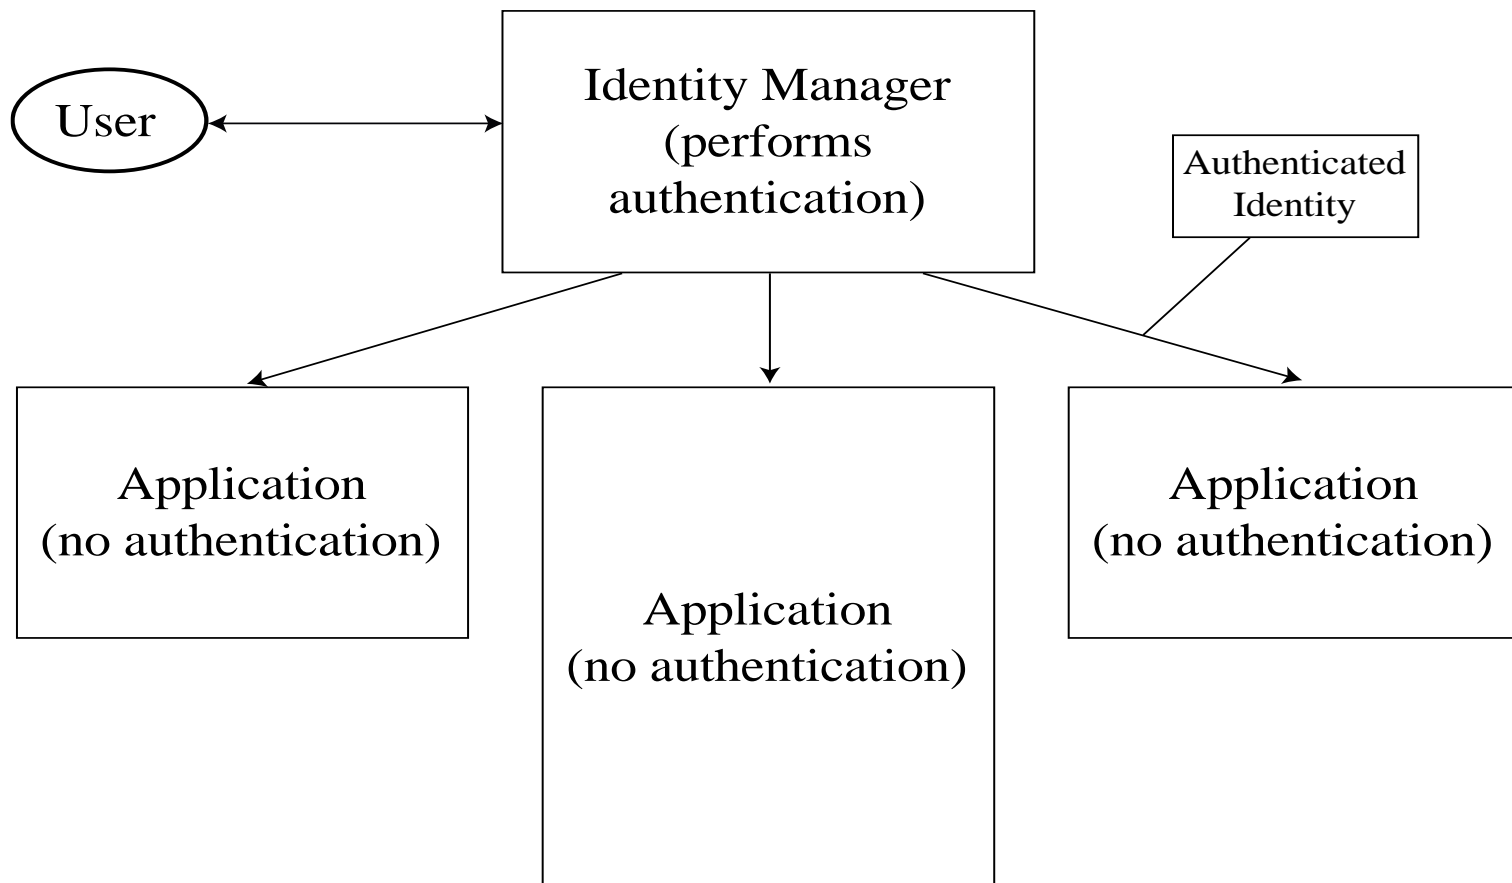

Clock  
synchronized to  
UCT

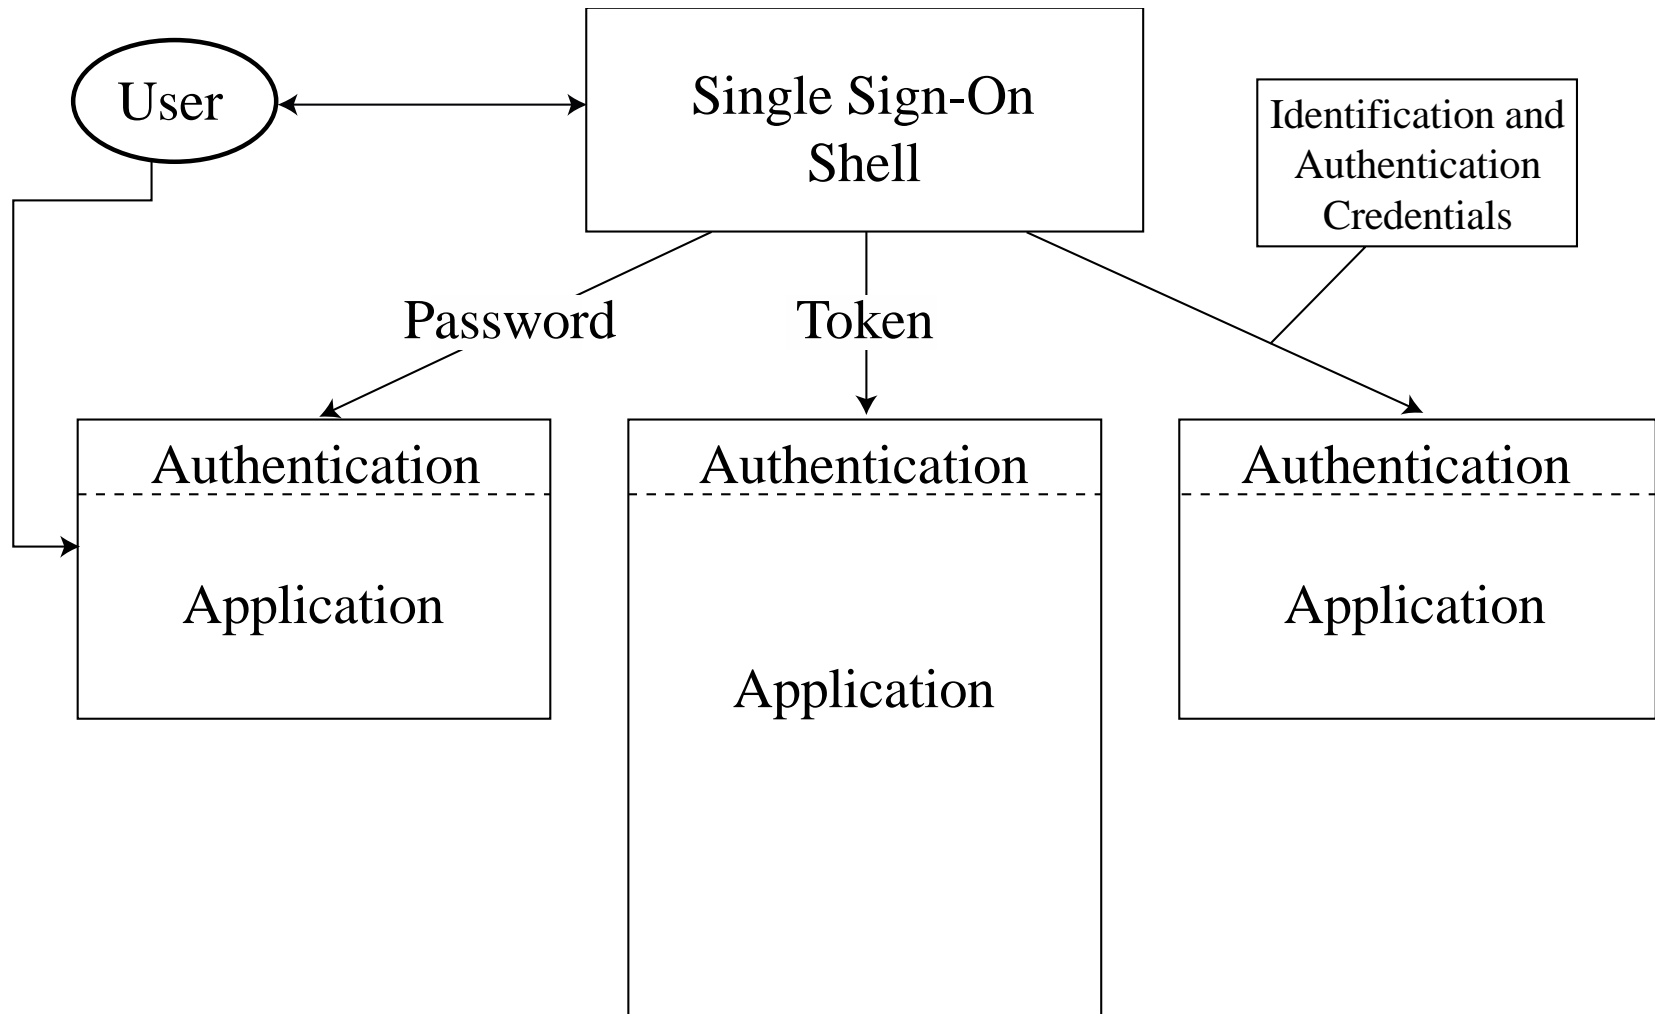

Unique seed

# Federated Identity Management

# Single Sign-On

# Access Control

# Access Policies

- Goals:
  - Check every access
  - Enforce least privilege
  - Verify acceptable usage
- Track users' access
- Enforce at appropriate granularity
- Use audit logging to track accesses

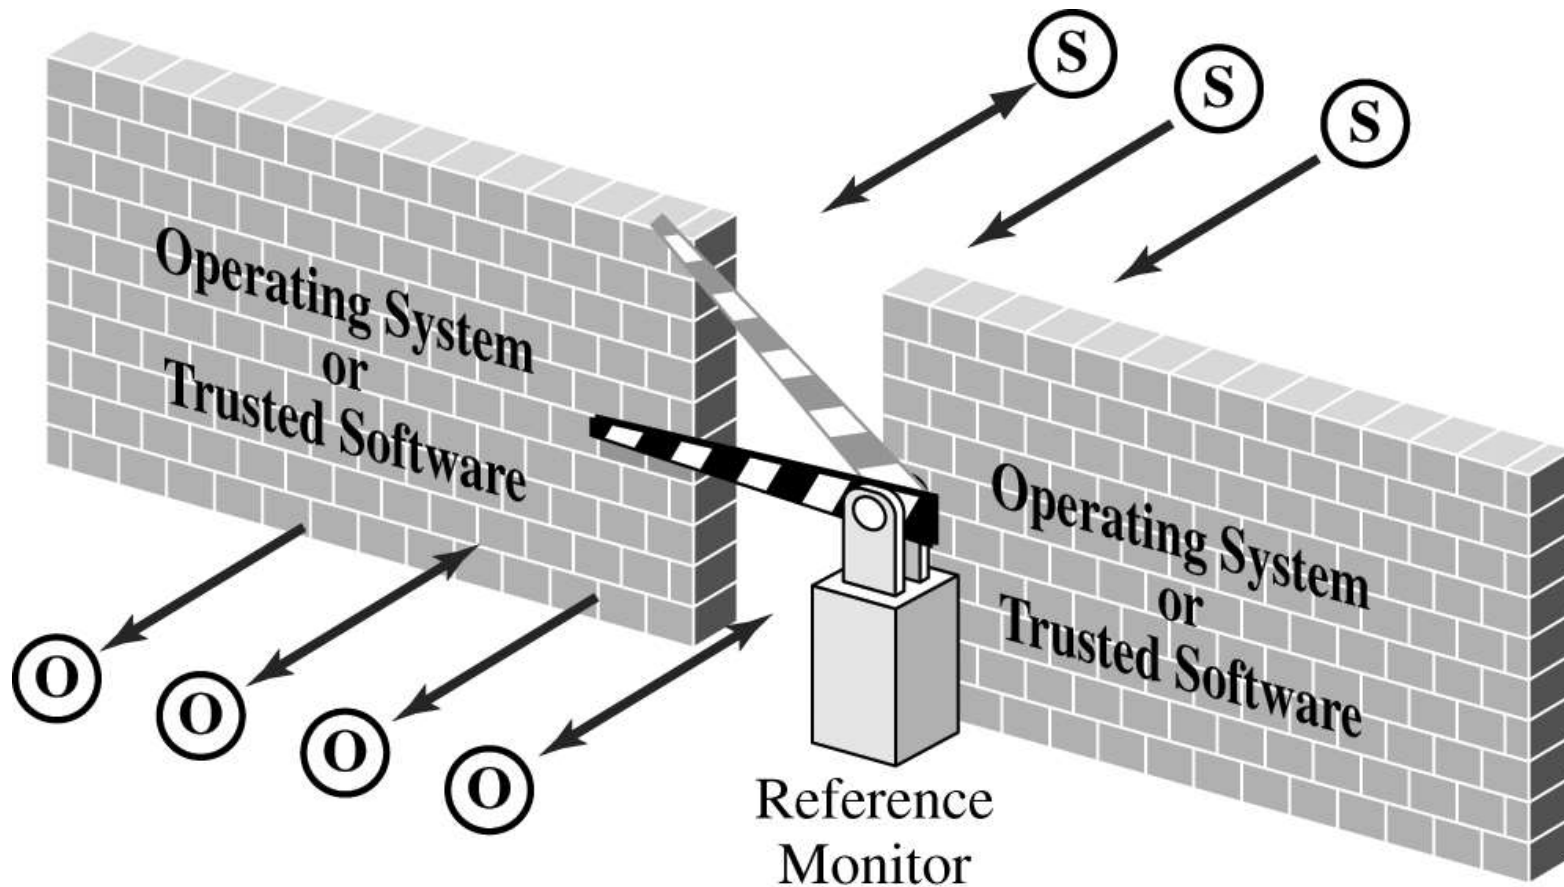

# Implementing Access Control

- Reference monitor
- Access control directory
- Access control matrix
- Access control list
- Privilege list
- Capability
- Procedure-oriented access control
- Role-based access control

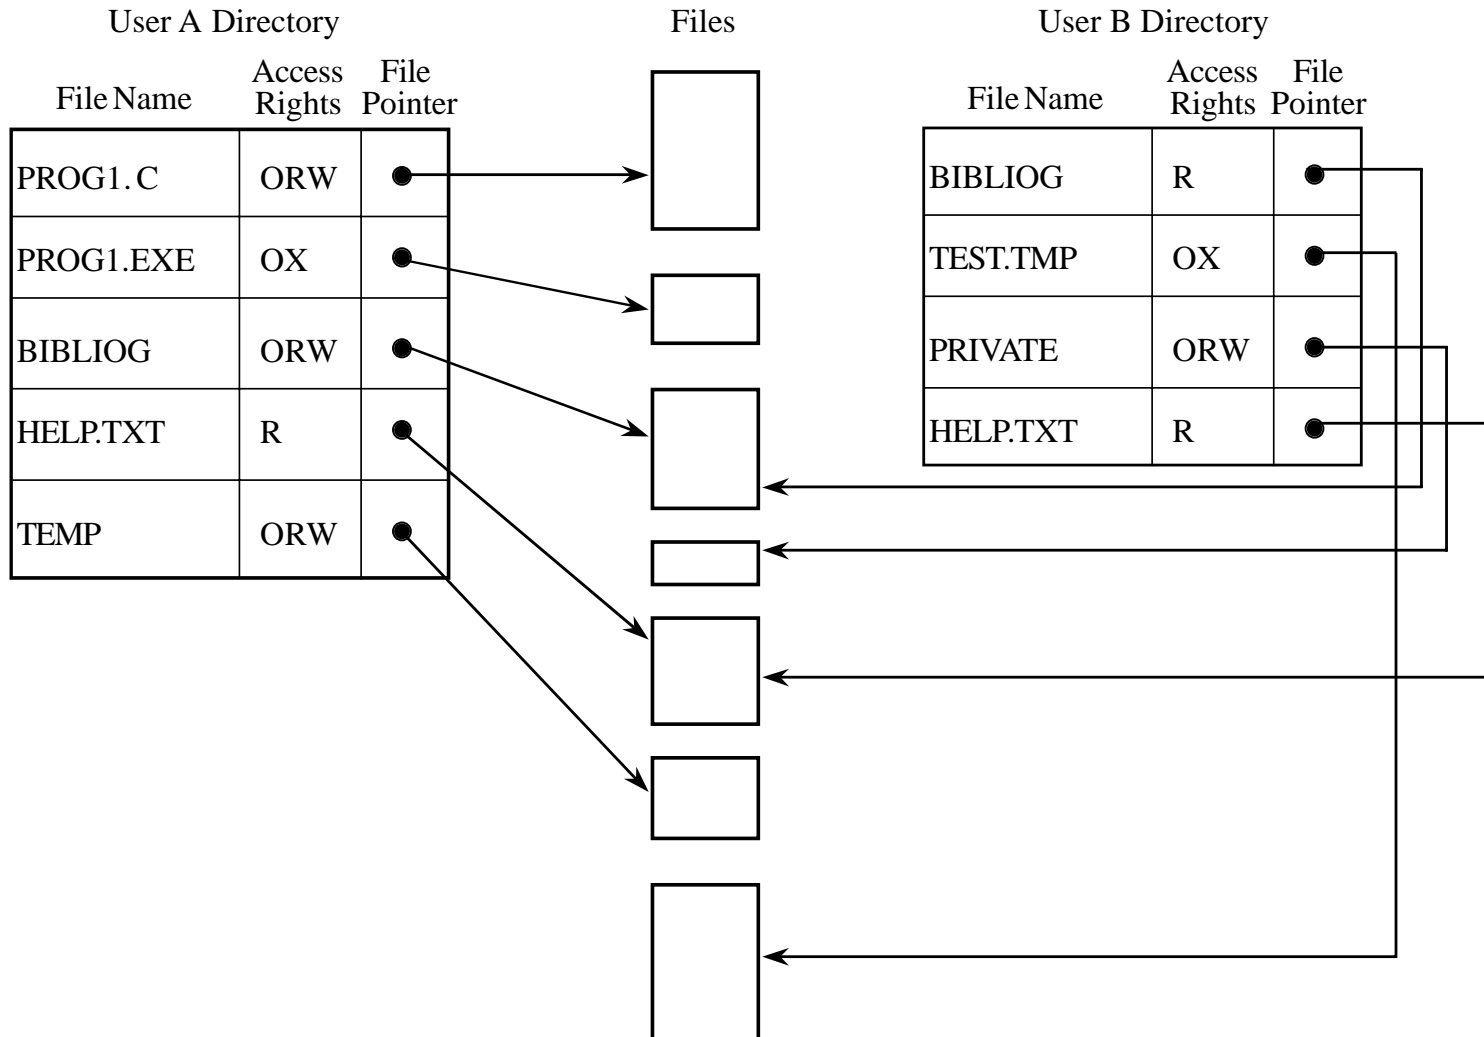

# Reference Monitor

# Access Control Directory

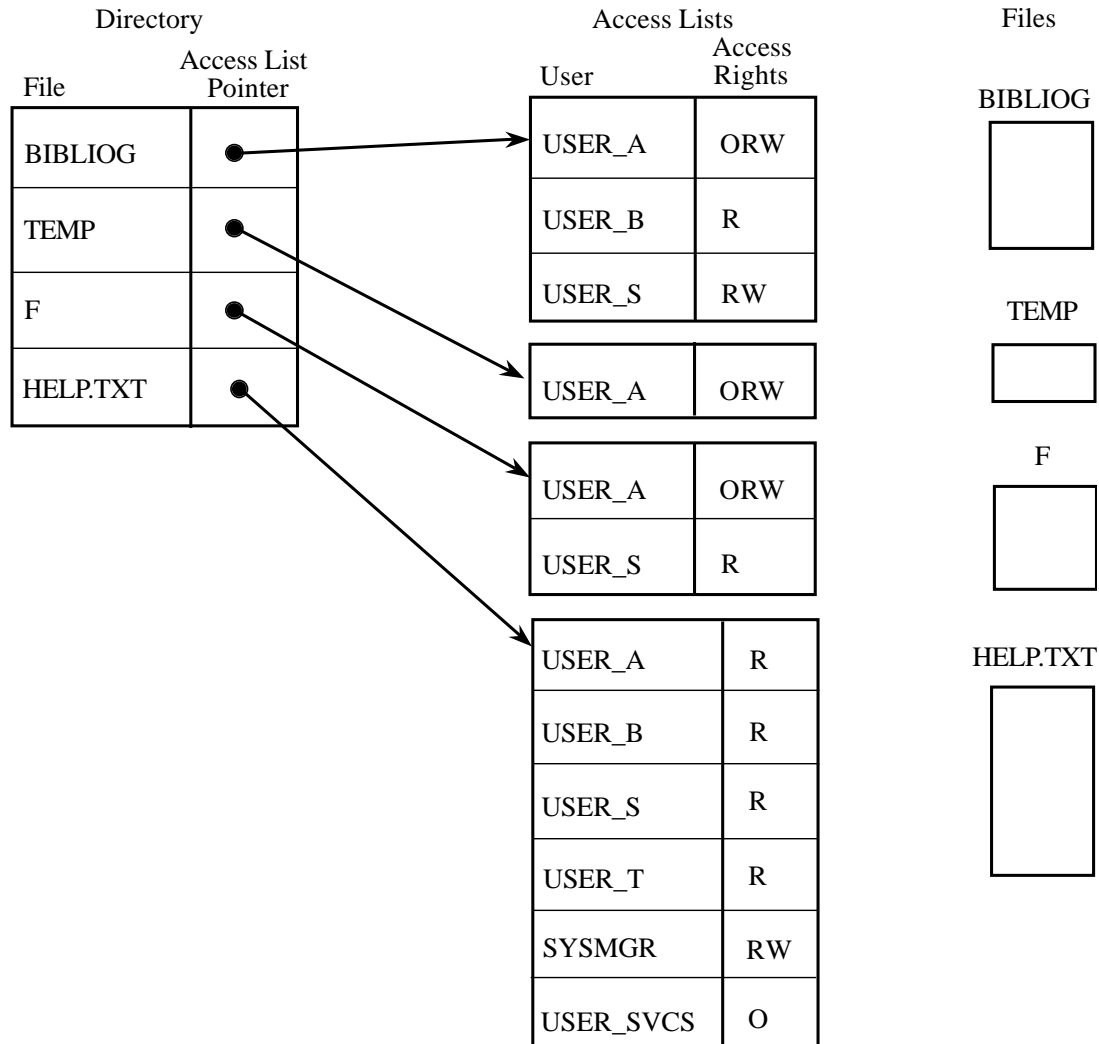

# Access Control Matrix

	BIBLIOG	TEMP	F	HELP.TXT	C_COMP	LINKER	SYS_CLOCK	PRINTER
<b>USER A</b>	ORW	ORW	ORW	R	X	X	R	W
<b>USER B</b>	R	-	-	R	X	X	R	W
<b>USER S</b>	RW	-	R	R	X	X	R	W
<b>USER T</b>	-	-	-	R	X	X	R	W
<b>SYS_MGR</b>	-	-	-	RW	OX	OX	ORW	O
<b>USER_SVCS</b>	-	-	-	O	X	X	R	W

# Access Control List

# Problems Addressed by Encryption

- Suppose a sender wants to send a message to a recipient. An attacker may attempt to
  - Block the message
  - Intercept the message
  - Modify the message
  - Fabricate an authentic-looking alternate message

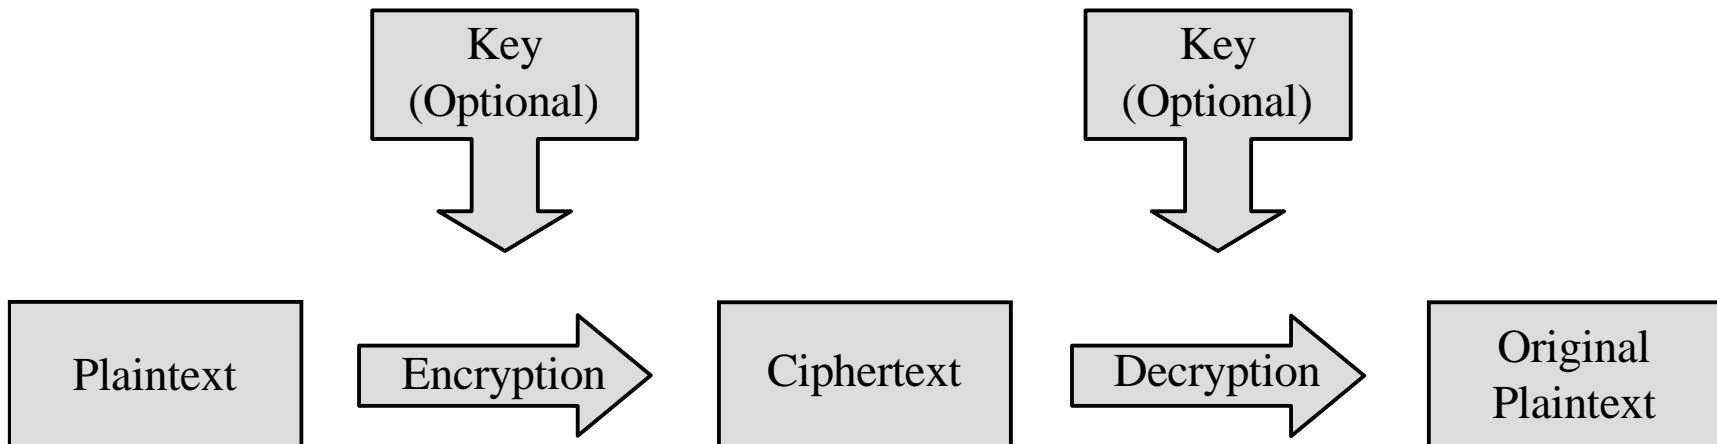

# Encryption Terminology

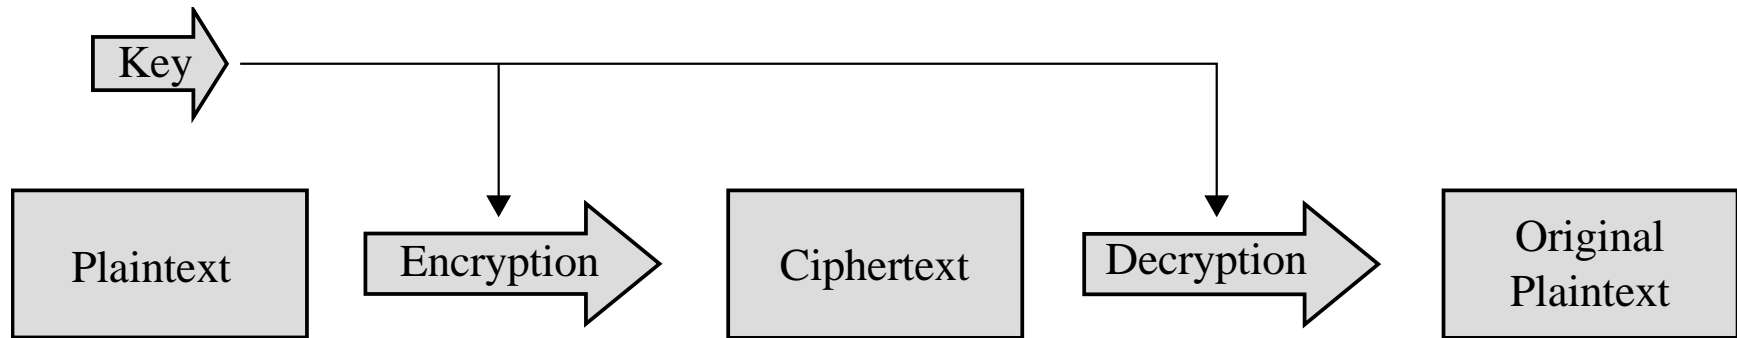

- Sender
- Recipient
- Transmission medium
- Interceptor/intruder
- Encrypt, encode, or encipher
- Decrypt, decode, or decipher
- Cryptosystem
- Plaintext
- Ciphertext

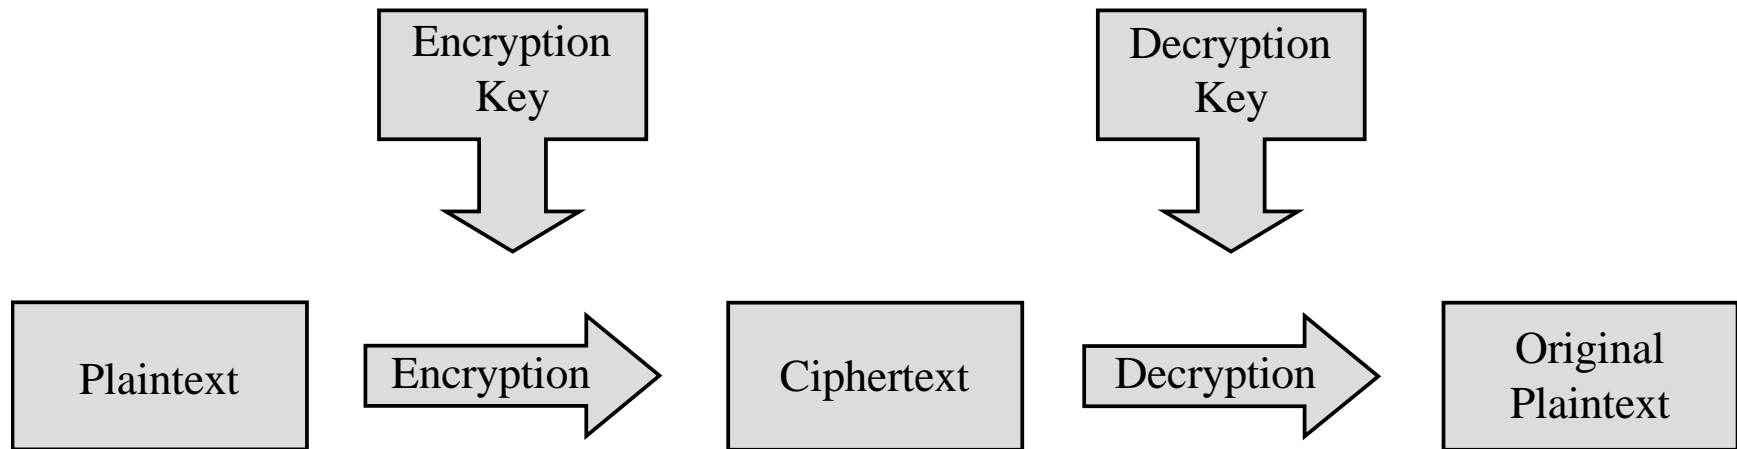

# Encryption/Decryption Process

# Symmetric vs. Asymmetric

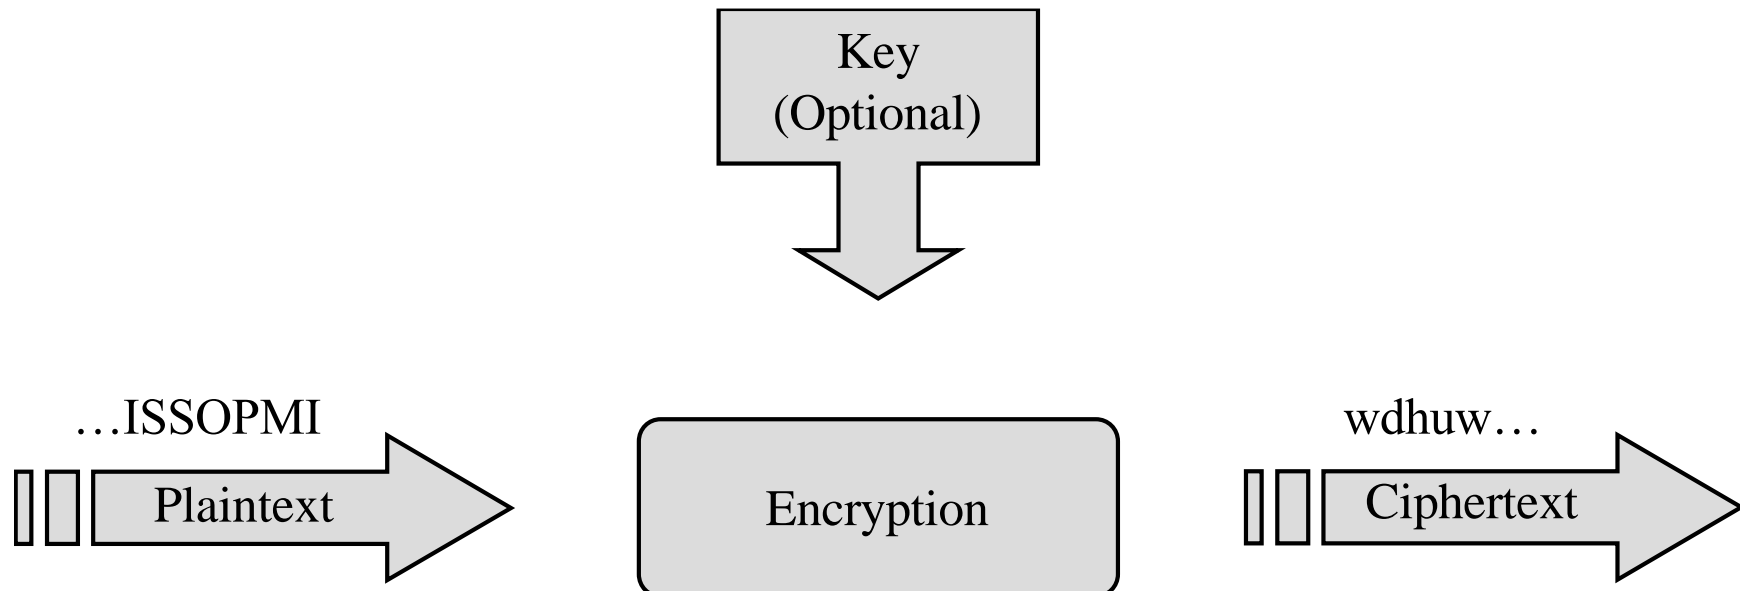

(a) Symmetric Cryptosystem

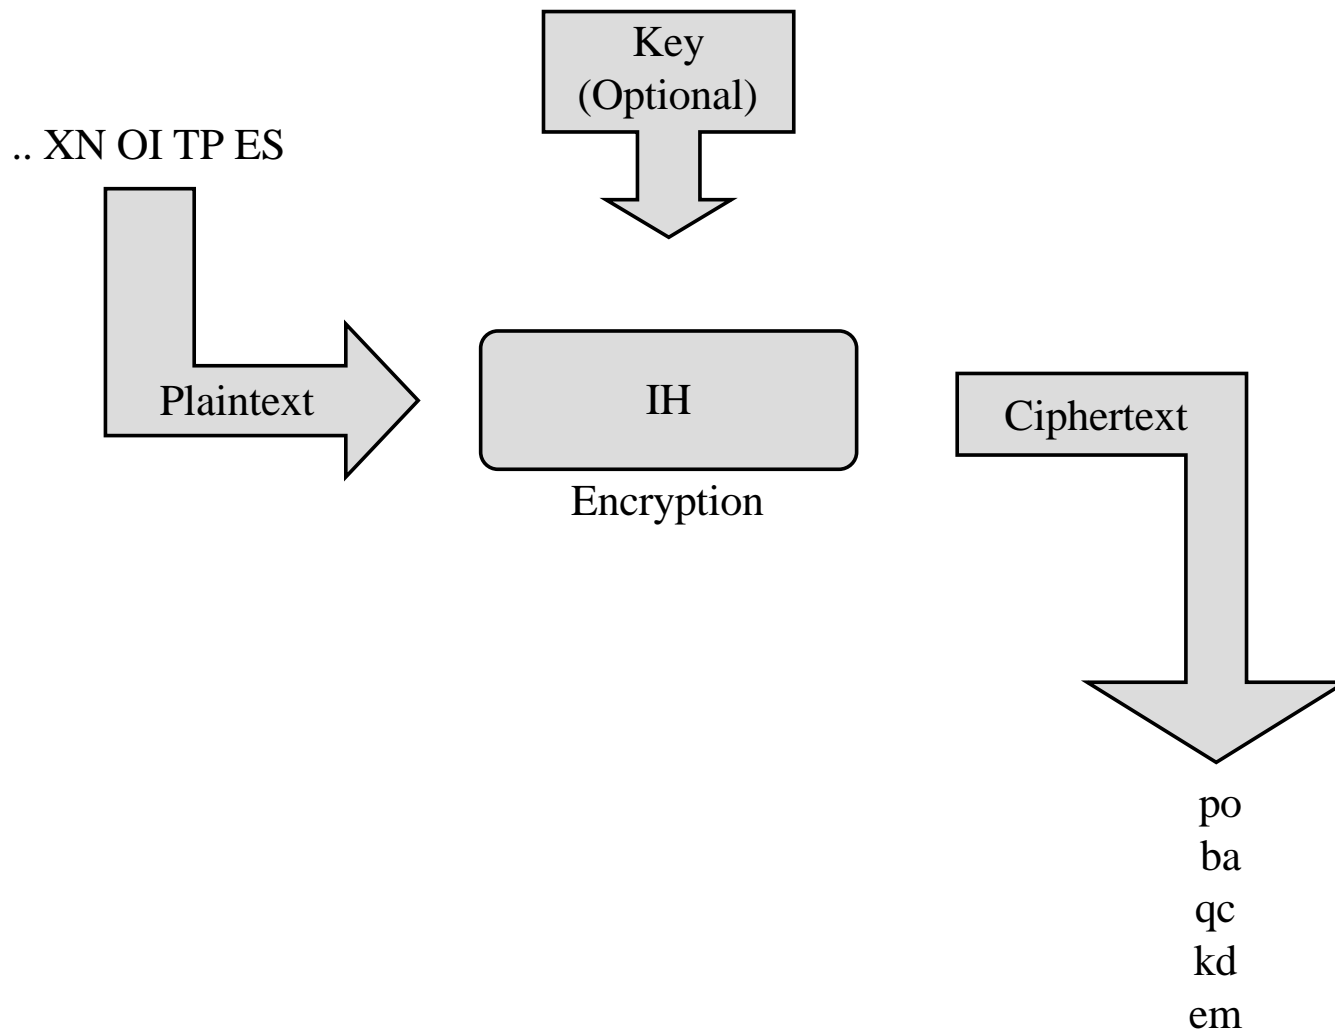

(b) Asymmetric Cryptosystem

# Stream Ciphers

# Block Ciphers

# Stream vs. Block

	Stream	Block
Advantages	<ul style="list-style-type: none"><li>• Speed of transformation</li><li>• Low error propagation</li></ul>	<ul style="list-style-type: none"><li>• High diffusion</li><li>• Immunity to insertion of symbol</li></ul>
Disadvantages	<ul style="list-style-type: none"><li>• Low diffusion</li><li>• Susceptibility to malicious insertions and modifications</li></ul>	<ul style="list-style-type: none"><li>• Slowness of encryption</li><li>• Padding</li><li>• Error propagation</li></ul>

# DES: The Data Encryption Standard

- Symmetric block cipher
- Developed in 1976 by IBM for the US National Institute of Standards and Technology (NIST)

Form	Operation	Properties	Strength
DES	Encrypt with one key	56-bit key	Inadequate for high-security applications by today's computing capabilities
Double DES	Encrypt with first key; then encrypt result with second key	Two 56-bit keys	Only doubles strength of 56-bit key version
Two-key triple DES	Encrypt with first key, then encrypt (or decrypt) result with second key, then encrypt result with first key (E-D-E)	Two 56-bit keys	Gives strength equivalent to about 80-bit key (about 16 million times as strong as 56-bit version)
Three-key triple DES	Encrypt with first key, then encrypt or decrypt result with second key, then encrypt result with third key (E-E-E)	Three 56-bit keys	Gives strength equivalent to about 112-bit key about 72 quintillion ( $72 \cdot 10^{15}$ ) times as strong as 56-bit version

# AES: Advanced Encryption System

- Symmetric block cipher
- Developed in 1999 by independent Dutch cryptographers
- Still in common use

# DES vs. AES

	<b>DES</b>	<b>AES</b>
<b>Date designed</b>	1976	1999
<b>Block size</b>	64 bits	128 bits
<b>Key length</b>	56 bits (effective length); up to 112 bits with multiple keys	128, 192, 256 (and possibly more) bits
<b>Operations</b>	16 rounds	10, 12, 14 (depending on key length); can be increased
<b>Encryption primitives</b>	Substitution, permutation	Substitution, shift, bit mixing
<b>Cryptographic primitives</b>	Confusion, diffusion	Confusion, diffusion
<b>Design</b>	Open	Open
<b>Design rationale</b>	Closed	Open
<b>Selection process</b>	Secret	Secret, but open public comments and criticisms invited
<b>Source</b>	IBM, enhanced by NSA	Independent Dutch cryptographers

# Public Key (Asymmetric) Cryptography

- Instead of two users sharing one secret key, each user has two keys: one public and one private
- Messages encrypted using the user's public key can only be decrypted using the user's private key, and vice versa

# Secret Key vs. Public Key Encryption

	<b>Secret Key (Symmetric)</b>	<b>Public Key (Asymmetric)</b>
<b>Number of keys</b>	1	2
<b>Key size (bits)</b>	56-112 (DES), 128-256 (AES)	Unlimited; typically no less than 256; 1000 to 2000 currently considered desirable for most uses
<b>Protection of key</b>	Must be kept secret	One key must be kept secret; the other can be freely exposed
<b>Best uses</b>	Cryptographic workhorse. Secrecy and integrity of data, from single characters to blocks of data, messages and files	Key exchange, authentication, signing
<b>Key distribution</b>	Must be out-of-band	Public key can be used to distribute other keys
<b>Speed</b>	Fast	Slow, typically by a factor of up to 10,000 times slower than symmetric algorithms

# Public Key to Exchange Secret Keys

1 Bill, give me your public key

Here is my key, Amy

3 Here is a symmetric key we can use

# Key Exchange Man in the Middle

# Error Detecting Codes

- Demonstrates that a block of data has been modified
- Simple error detecting codes:
  - Parity checks
  - Cyclic redundancy checks
- Cryptographic error detecting codes:
  - One-way hash functions
  - Cryptographic checksums
  - Digital signatures

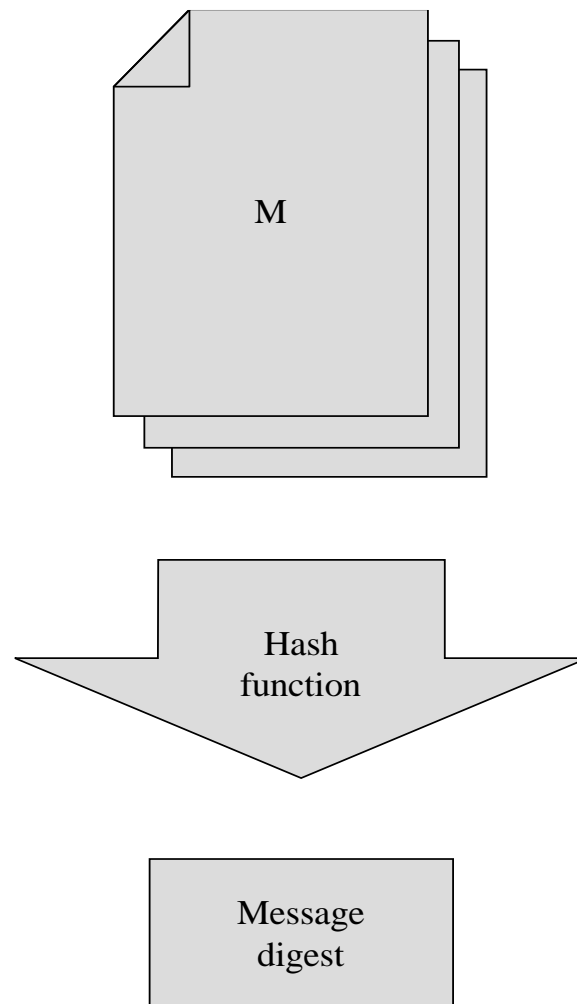

# Parity Check

Original Data	Parity Bit	Modified Data	Modification Detected?
0 0 0 0 0 0 0 0	1	0 0 0 0 0 0 0 <u>1</u>	Yes
0 0 0 0 0 0 0 0	1	<u>1</u> 0 0 0 0 0 0 0	Yes
0 0 0 0 0 0 0 0	1	<u>1</u> 0 0 0 0 0 0 <u>1</u>	No
0 0 0 0 0 0 0 0	1	0 0 0 0 0 0 <u>1</u> <u>1</u>	No
0 0 0 0 0 0 0 0	1	0 0 0 0 0 <u>1</u> <u>1</u> <u>1</u>	Yes
0 0 0 0 0 0 0 0	1	0 0 0 0 <u>1</u> <u>1</u> <u>1</u> <u>1</u>	No
0 0 0 0 0 0 0 0	1	0 <u>1</u> 0 <u>1</u> 0 <u>1</u> 0 <u>1</u>	No
0 0 0 0 0 0 0 0	1	<u>1</u> <u>1</u> <u>1</u> <u>1</u> <u>1</u> <u>1</u> <u>1</u> <u>1</u>	No

# One-Way Hash Function

# Digital Signature

# Certificates: Trustable Identities and Public Keys

- A certificate is a public key and an identity bound together and signed by a certificate authority.
- A certificate authority is an authority that users trust to accurately verify identities before generating certificates that bind those identities to keys.

# Certificate Signing and Hierarchy

### To create Diana's certificate:

Diana creates and delivers to Edward:

Name: Diana
Position: Division Manager
Public key: 17EF83CA ...

Edward adds:

Name: Diana	hash value
Position: Division Manager	128C4
Public key: 17EF83CA ...	

Edward signs with his private key:

Name: Diana	hash value
Position: Division Manager	128C4
Public key: 17EF83CA ...	

Which is Diana's certificate.

### To create Delwyn's certificate:

Delwyn creates and delivers to Diana:

Name: Delwyn
Position: Dept Manager
Public key: 3AB3882C ...

Diana adds:

Name: Delwyn	hash value
Position: Dept Manager	48CFA
Public key: 3AB3882C ...	

Diana signs with her private key:

Name: Delwyn	hash value
Position: Dept Manager	48CFA
Public key: 3AB3882C ...	

And appends her certificate:

Name: Delwyn	hash value
Position: Dept Manager	48CFA
Public key: 3AB3882C ...	
Name: Diana	hash value
Position: Division Manager	128C4
Public key: 17EF83CA ...	

Which is Delwyn's certificate.

# Cryptographic Tool Summary

<b>Tool</b>	<b>Uses</b>
<b>Secret key (symmetric) encryption</b>	Protecting confidentiality and integrity of data at rest or in transit
<b>Public key (asymmetric) encryption</b>	Exchanging (symmetric) encryption keys Signing data to show authenticity and proof of origin
<b>Error detection codes</b>	Detect changes in data
<b>Hash codes and functions (forms of error detection codes)</b>	Detect changes in data
<b>Cryptographic hash functions</b>	Detect changes in data, using a function that only the data owner can compute (so an outsider cannot change both data and the hash code result to conceal the fact of the change)
<b>Error correction codes</b>	Detect and repair errors in data
<b>Digital signatures</b>	Attest to the authenticity of data
<b>Digital certificates</b>	Allow parties to exchange cryptographic keys with confidence of the identities of both parties

# Summary

- Users can authenticate using something they know, something they are, or something they have
- Systems may use a variety of mechanisms to implement access control
- Encryption helps prevent attackers from revealing, modifying, or fabricating messages
- Symmetric and asymmetric encryption have complementary strengths and weaknesses
- Certificates bind identities to digital signatures
