

Linear PDE of 2<sup>nd</sup> and higher order with constant coefficients.

Homogeneous Linear PDEs:

A linear PDE with constant coefficients in which all the partial derivatives are of the same order is called homogeneous; otherwise it is called non-homogeneous.

Example:

Homogeneous Equation:

$$\frac{\partial^2 z}{\partial x^2} + 5 \frac{\partial^2 z}{\partial x \partial y} + 6 \frac{\partial^2 z}{\partial y^2} = \sin x$$

Non-homogeneous Equation:

$$\frac{\partial^2 z}{\partial x^2} - 5 \frac{\partial z}{\partial x} + 7 \frac{\partial z}{\partial y} + \frac{\partial^2 z}{\partial y^2} = e^{x+y}$$

Notation:

$$D = \frac{\partial}{\partial x}, \quad D' = \frac{\partial}{\partial y}$$

Method of finding complementary function (CF)

Let the given equation be of the form

$$f(D, D')z = f(x, y).$$

Put  $D = m$

$D' = 1$

$f(m, 1) = 0 \Rightarrow a_0 m^n + a_1 m^{n-1} + \dots + a_n = 0$

Let the roots of the eqn. be  $m_1, m_2, \dots, m_n$

Roots

complementary function

1. The roots are different.

$m_1, m_2, \dots, m_n$

$CF = f_1(y+m_1x) + f_2(y+m_2x) + \dots + f_n(y+m_nx)$

2. The roots are equal.

$m_1 = m_2 = \dots = m_n$

(say)  $m = m$

$CF = f_1(y+mx) + x f_2(y+mx) + \dots + x^{n-1} f_n(y+mx)$

General Solution is  $y = CF + PI$

RHS = 0 ( $z = CF$ )

1. Solve  $(D^2 - 6DD' + 9D'^2)z = 0$

Soln.:

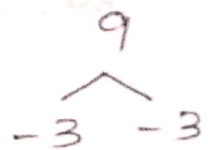

Put  $D = m, D' = 1$

The auxiliary equation is,

$m^2 - 6m + 9 = 0$

$(m-3)(m-3) = 0$

$m = 3, 3$  (equal roots)

The solution is

$z = CF$

$= f_1(y+3x) + x f_2(y+3x)$

$$\text{RHS} = e^{ax+by}$$

Replace  $D$  by  $a$   
 $D'$  by  $b$

11. Solve  $(D^2 - 5DD' + 6D'^2)z = e^{x+y}$

Soln:

The auxiliary equation is

$$m^2 - 5m + 6 = 0$$

$$\begin{matrix} (D \rightarrow m \\ D' \rightarrow 1 \end{matrix}$$

$$(m-3)(m-2) = 0$$

$$m = 2, 3 \text{ (Different)}$$

$$\begin{matrix} 6 \\ / \quad \backslash \\ -3 \quad -2 \end{matrix}$$

$$\text{CF} = \delta_1(y+2x) + \delta_2(y+3x)$$

$$\text{PI} = \frac{1}{D^2 - 5DD' + 6D'^2} e^{x+y}$$

$$= \frac{1}{1-5+6} e^{x+y}$$

Replace

$$D \rightarrow a=1$$

$$D' \rightarrow b=1$$

$$= \frac{1}{2} e^{x+y}$$

The solution is,

$$z = \text{CF} + \text{PI}$$

$$= \delta_1(y+2x) + \delta_2(y+3x) + \frac{e^{x+y}}{2}$$

12. Solve  $(D^2 - 4DD' + 4D'^2)z = e^{2x+y}$

Soln:

The auxiliary equation is

$$m^2 - 4m + 4 = 0$$

$$(m-2)(m-2) = 0$$

$$m = 2, 2 \text{ (Equal)}$$

$$\begin{matrix} 4 \\ / \quad \backslash \\ -2 \quad -2 \end{matrix}$$

$$\text{CF} = \delta_1(y+2x) + x\delta_2(y+2x)$$

$$PI = \frac{1}{D^2 - 4DD' + 4D'^2} e^{2x+y}$$

$$= \frac{1}{2^2 - 4(2)(1) + 4(1)^2} e^{2x+y} \quad \begin{array}{l} \text{Replace} \\ D \rightarrow a=2 \\ D' \rightarrow b=1 \end{array}$$

$$= \frac{1}{4 - 8 + 4} e^{2x+y} \quad [\text{multiply } x \text{ in the Nr \& differentiate w.r.t } D]$$

$$= x \frac{1}{2D - 4D'} e^{2x+y}$$

$$= x^2 \frac{1}{2} e^{2x+y} \quad \begin{array}{l} D \rightarrow 2 \\ D' \rightarrow 1 \end{array}$$

$$= \frac{x^2}{2} e^{2x+y}$$

The solution is  $z = CF + PI$

$$= f_1(y+2x) + x f_2(y+2x) + \frac{x^2}{2} e^{2x+y}$$
