## ACCELERATION DIAGRAM FOR A LINK

- Consider two points A and B on a rigid link as shown in Figure 1.
- Let the point B moves with respect to A, with an angular velocity of  $\omega$  rad/s and let  $\alpha$  rad/s<sup>2</sup> be the angular acceleration of the link AB.

**FIGURE 1**

SOURCES: KHURMI R S

**FIGURE 2**

## MOTION OF A LINK

velocity of any point on a link with respect to another point on the same link is always perpendicular to the line joining these points on the configuration (or space) diagram.

## ACCELERATION IN THE SLIDER CRANK MECHANISM

- A slider crank mechanism is shown in Figure in **slide number 9**.
- Let the crank OB makes an angle  $\theta$  with the inner dead centre (I.D.C) and rotates in a clockwise direction about the fixed point O with uniform angular velocity  $\omega_{BO}$  rad/s.

*BOARD USAGE ALSO*

## ACCELERATION IN THE SLIDER CRANK MECHANISM

Velocity of B with respect to O or velocity of B (because O is a fixed point),

$$\mathbf{V}_{BO} = \mathbf{V}_B = \boldsymbol{\omega}_B \cdot \mathbf{BO}, \text{ acting tangentially at B.}$$

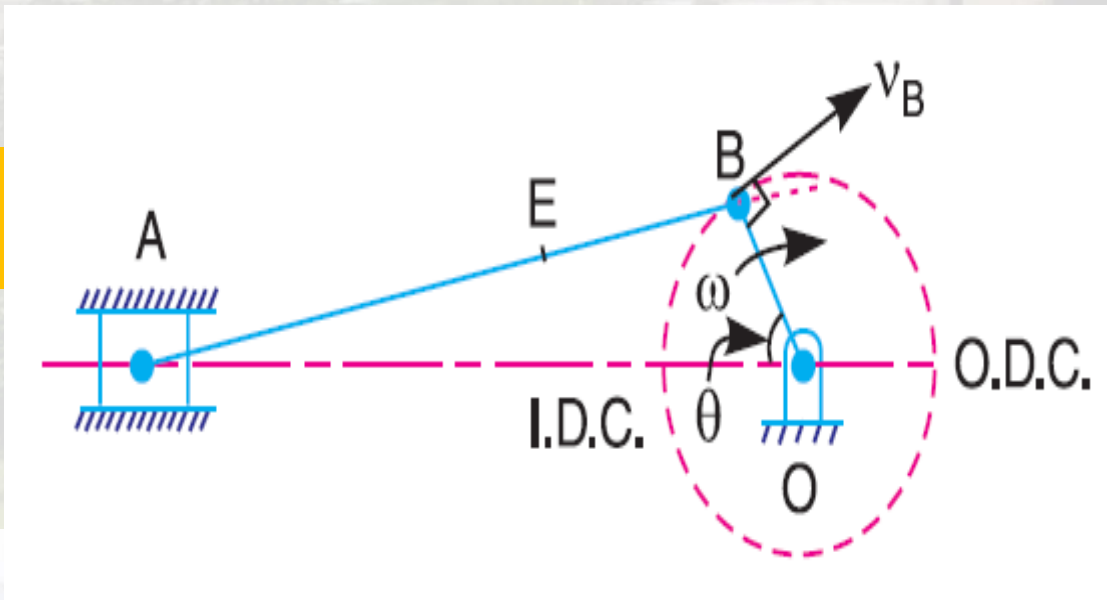

**Note :** A point at the end of a link which moves with constant angular velocity has no tangential component of acceleration.

## RUBBING VELOCITY AT A PIN JOINT

According to the definition,

Rubbing velocity at the pin joint O

$= (\omega_1 - \omega_2) r$ , if the links move in the same direction

$= (\omega_1 + \omega_2) r$ , if the links move in the opposite direction

Rubbing velocity at the pin joint  $= \omega \cdot r$

where  $\omega$  = Angular velocity of the turning member, and

$r$  = Radius of the pin.

## ASSESSMENT QUESTIONS

1. The crank of a slider crank mechanism rotates clockwise at a constant speed of 300 r.p.m. The crank is 150 mm and the connecting rod is 600 mm long. Determine :

- linear velocity and acceleration of the midpoint of the connecting rod, and
- angular velocity and angular acceleration of the connecting rod, at a crank angle of  $45^\circ$  from inner dead centre position.
