# **ENGINE TESTING PROCEDURES AND SCHEDULE PREPARATION**

**SNS COLLEGE OF TECHNOLOGY**  
**(Autonomous)**  
**DEPARTMENT OF AERONAUTICAL ENGINEERING**

**In order to repeat any given test at some time in the future, it is essential that all variables are noted, for example:**

- Engine build specification
- Ignition and injection timing
- Type of fuel, oil and coolant
- Position of sensors on the engine and within the cell

It will be impossible to replicate tests at some time in the future if one does not have full records of engine build, cam timing, ignition and injection timing, compression ratio, fuel, oil and coolant used.

**DEPARTMENT OF AERONAUTICAL ENGINEERING**

## **Calibration Equipment Identification**

Where possible all critical equipment shall be tagged or labelled with the serial number, frequency of calibration and calibration status shown on the tag or label.

# Engine Tests used within the testing industry:

- **Durability (Design Validation Test)** Within this group is;
- Steady load and speed operation
- Load cycling
- Speed cycling
- Thermal shock cycling
- Component development
- Vehicle cycle simulation

## **Performance, Within this group is;**

Power curves

Governor curves

Lubrication oil consumption

Flow measurements

Heat balance

Emissions measurement

—

**SNS COLLEGE OF TECHNOLOGY**

**DEPARTMENT OF AERONAUTICAL ENGINEERING**

## **Lubricants & Fuels Within this group is;**

- Automotive lubricants
- Marine lubricants
- Black sludge formation
- Intake valve deposits
- Combustion chamber deposits

# Specialised investigations and testing

- Rig testing (bearings, antifreeze, erosion etc.)
- Simulated or environmental testing
- Photo elastic stress measurements
- Strain gauge testing
- Flywheel burst testing

# **Exhaust system testing**

- Vehicle cycle simulation
- Steady state

# Catalyst ageing

- Vehicle cycle simulation
- Steady state
- Accelerated ageing
- Light off efficiency tests
- Sulphate release tests

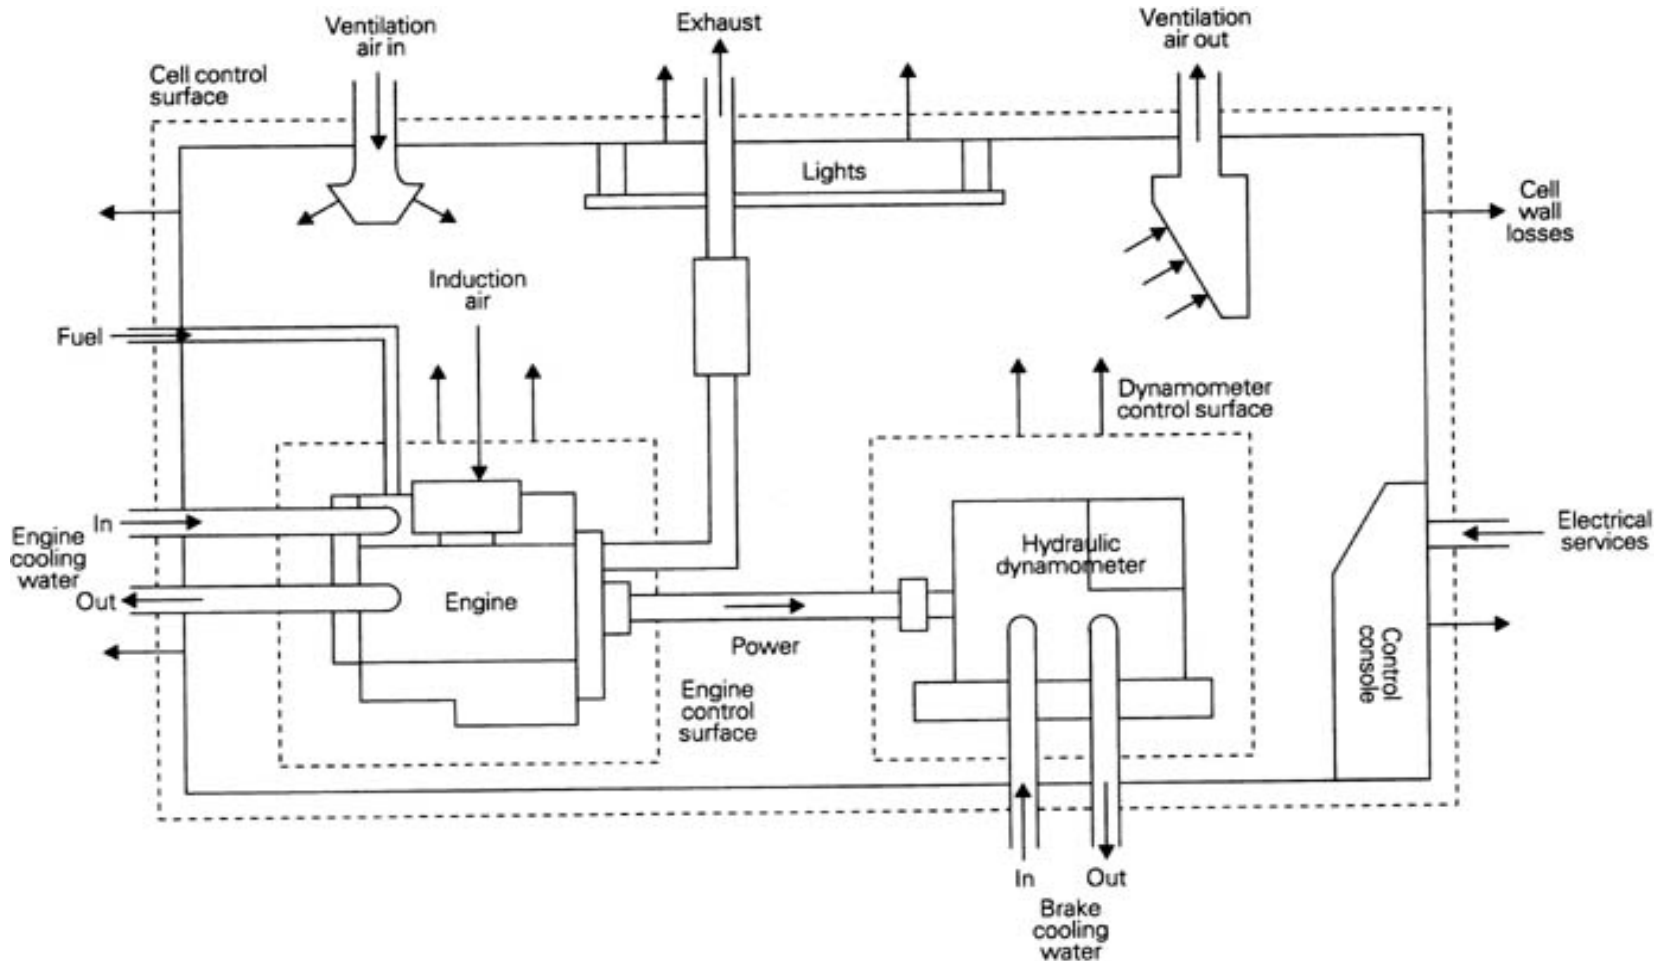

## **Transient testing**

- Fully transient tests and indeed automatic mapping software programmes are disciplines worthy of additional study, however, in order to glean the maximum useful repeatable data from all forms of transient testing, it is essential to have a full understanding and experience of steady state test types. Mathematical modelling of engine functions is an essential element in the design and development of new engine types. It is the accurate cross correlation of modelled data with actual running data that enables the leading manufacturers to rapidly move ahead of the opposition and obtain clear market gains.

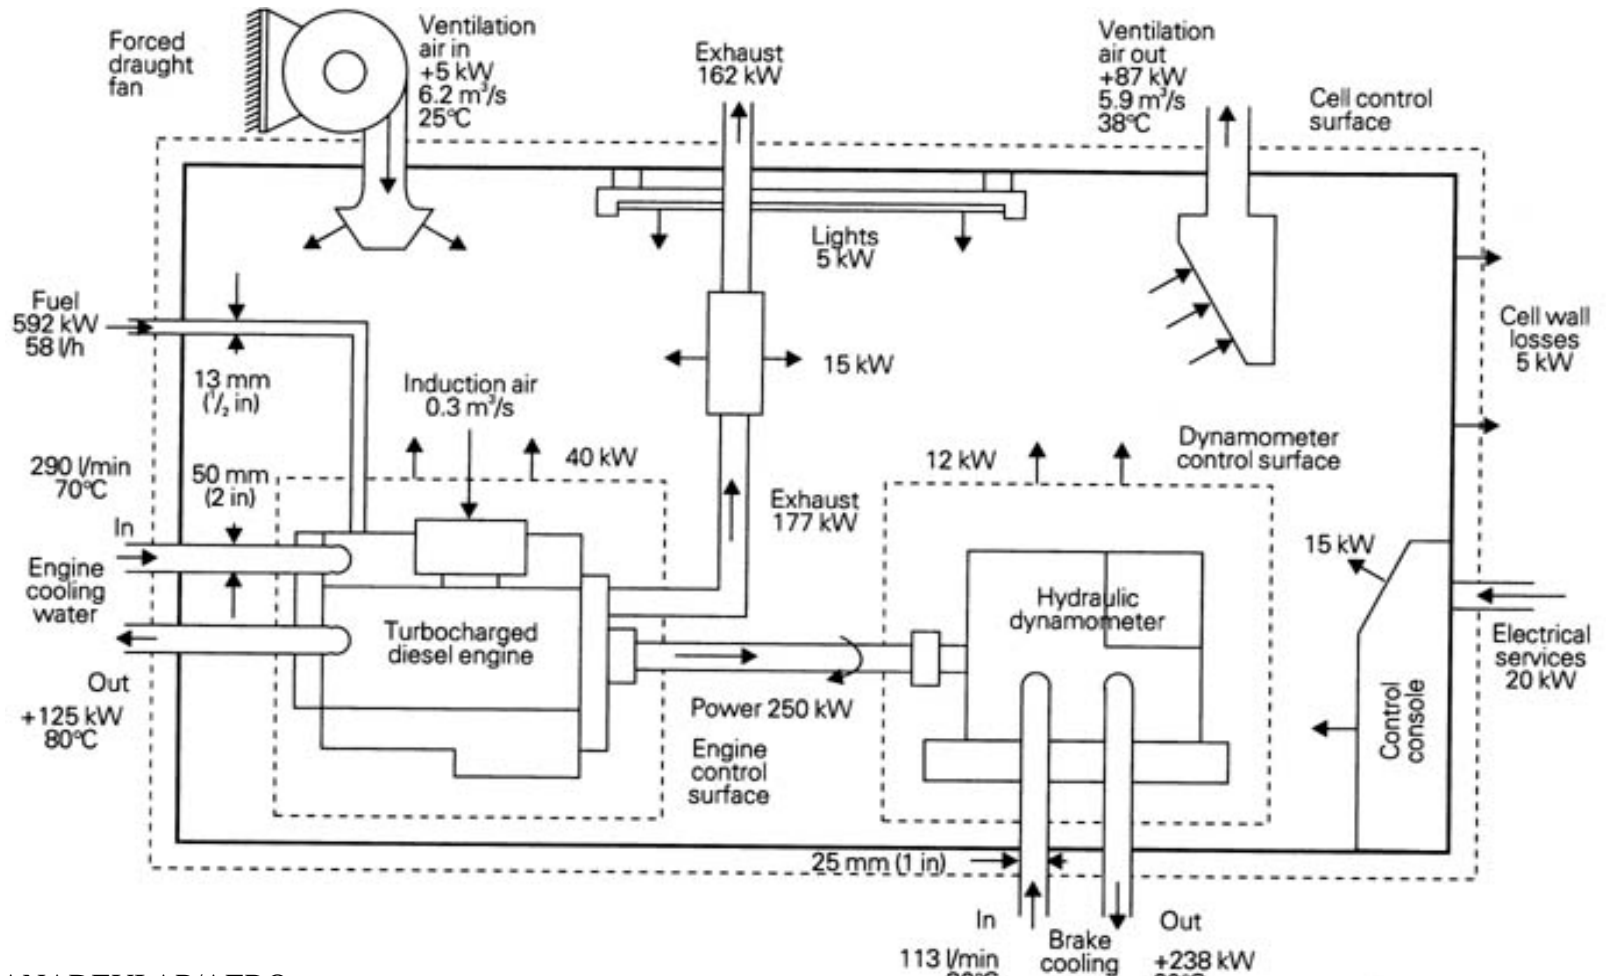

# Services in and out of the test cell

# Energy balance, the test cell as a unique system

## **Installation within the test cell**

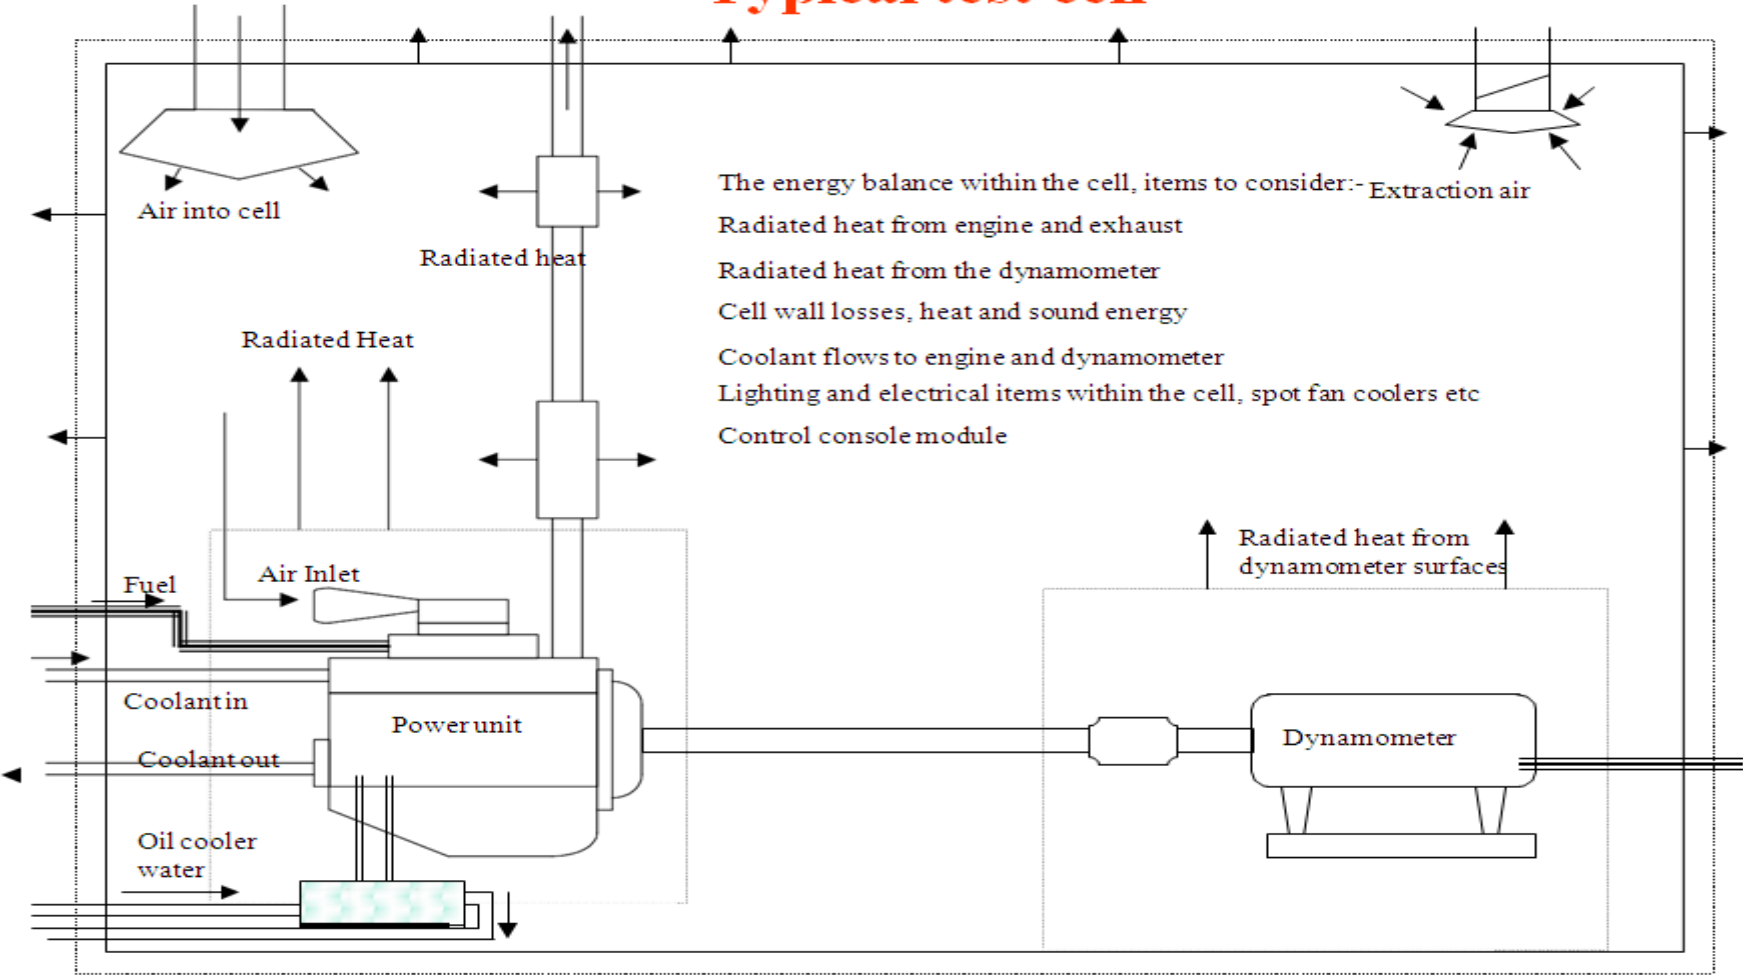

- Pallet
- QA ~ Instructions
- Documentation
- Items used
- Alignment
- Drive shafts
- Containment

SNS COLLEGE OF TECHNOLOGY

DEPARTMENT OF AERONAUTICAL ENGINEERING

# Typical test cell

The energy balance within the cell, items to consider:-  
Extraction air  
Radiated heat from engine and exhaust  
Radiated heat from the dynamometer  
Cell wall losses, heat and sound energy  
Coolant flows to engine and dynamometer  
Lighting and electrical items within the cell, spot fan coolers etc  
Control console module
