Coimbatore-35.

An Autonomous Institution

COURSE NAME : 19CST101 PROGRAMMING FOR PROBLEM SOLVING

I YEAR/ I SEMESTER

UNIT-III ARRAYS AND STRINGS

Topic: Strings

Mrs. S.R.JANANI

Assistant Professor

Department of Computer Science and Engineering

C Strings

The string can be defined as the one-dimensional array of characters terminated by a null ('\0'). The character array or the string is used to manipulate text such as word or sentences. Each character in the array occupies one byte of memory, and the last character must always be 0. The termination character ('\0') is important in a string since it is the only way to identify where the string ends. When we define a string as `char s[10]`, the character `s[10]` is implicitly initialized with the null in the memory.

String is a set of characters enclosed in double quotation marks. In C programming, the string is a character array of single dimension.

For example: The string "hello world" contains 12 characters including '\0' character which is automatically added by the compiler at the end of the string.

C Strings

There are two ways to declare a string in c language.

1. By char array
2. By string literal

Let's see the example of declaring **string by char array** in C language.

```
char ch[10]={'j', 'a', 'v', 'a', 't', 'p', 'o', 'i', 'n', 't', '\0'};
```

As we know, array index starts from 0, so it will be represented as in the figure given below.

0	1	2	3	4	5	6	7	8	9	10
j	a	v	a	t	p	o	i	n	t	\0

C Strings

While declaring string, size is not mandatory. So we can write the above code as given below:

```
char ch[]={ 'j', 'a', 'v', 'a', 't', 'p', 'o', 'i', 'n', 't', '\0' };
```

We can also define the **string by the string literal** in C language. For example:

```
char ch[]="javatpoint";
```

In such case, '\0' will be appended at the end of the string by the compiler.

C Strings

Difference between char array and string literal

There are two main differences between char array and literal.

- We need to add the null character '\0' at the end of the array by ourself whereas, it is appended internally by the compiler in the case of the character array.
- The string literal cannot be reassigned to another set of characters whereas, we can reassign the characters of the array.

C Strings

String Example in C

Let's see a simple example where a string is declared and being printed. The '%s' is used as a format specifier for the string in c language.

```
#include<stdio.h>
#include <string.h>
int main(){
    char ch[11]={'j', 'a', 'v', 'a', 't', 'p', 'o', 'i', 'n', 't', '\0'};
    char ch2[11]="javatpoint";

    printf("Char Array Value is: %s\n", ch);
    printf("String Literal Value is: %s\n", ch2);
    return 0;
}
```

C Strings

Output

```
Char Array Value is: javatpoint  
String Literal Value is: javatpoint
```

Traversing String

Traversing the string is one of the most important aspects in any of the programming languages. We may need to manipulate a very large text which can be done by traversing the text. Traversing string is somewhat different from the traversing an integer array. We need to know the length of the array to traverse an integer array, whereas we may use the null character in the case of string to identify the end of the string and terminate the loop.

Hence, there are two ways to traverse a string.

- By using the length of string
- By using the null character.

Traversing String

Using the length of string

Let's see an example of counting the number of vowels in a string.

```
#include<stdio.h>
void main ()
{
    char s[11] = "javatpoint";
    int i = 0;
    int count = 0;
    while(i<11)
    {
        if(s[i]=='a' || s[i] == 'e' || s[i] == 'i' || s[i] == 'u' || s[i] == 'o')
        {
            count ++;
        }
        i++;
    }
    printf("The number of vowels %d",count);
}
```

Traversing String

Output

```
The number of vowels 4
```

Traversing String

Using the null character

Let's see the same example of counting the number of vowels by using the null character.

```
#include<stdio.h>
void main ()
{
    char s[11] = "javatpoint";
    int i = 0;
    int count = 0;
    while(s[i] != NULL)
    {
        if(s[i]=='a' || s[i] == 'e' || s[i] == 'i' || s[i] == 'u' || s[i] == 'o')
        {
            count ++;
        }
        i++;
    }
    printf("The number of vowels %d",count);
}
```

Traversing String

Output

```
The number of vowels 4
```

Accepting string as the input

Till now, we have used scanf to accept the input from the user. However, it can also be used in the case of strings but with a different scenario. Consider the below code which stores the string while space is encountered.

```
#include<stdio.h>

void main ()
{
    char s[20];
    printf("Enter the string?");
    scanf("%s",s);
    printf("You entered %s",s);
}
```

Accepting string as the input

Output

```
Enter the string?javatpoint is the best
You entered javatpoint
```

It is clear from the output that, the above code will not work for space separated strings. To make this code working for the space separated strings, the minor changed required in the scanf function, i.e., instead of writing `scanf("%s",s)`, we must write: `scanf("%[^\n]s",s)` which instructs the compiler to store the string `s` while the new line (`\n`) is encountered. Let's consider the following example to store the space-separated strings.

Accepting string as the input

```
#include<stdio.h>
void main ()
{
    char s[20];
    printf("Enter the string?");
    scanf("%[^\n]s",s);
    printf("You entered %s",s);
}
```

Output

```
Enter the string?javatpoint is the best
You entered javatpoint is the best
```

Here we must also notice that we do not need to use address of (&) operator in scanf to store a string since string s is an array of characters and the name of the array, i.e., s indicates the base address of the string (character array) therefore we need not use & with it.
