Problems :

① Reduce the quadratic form  $6x^2 + 3y^2 + 3z^2 - 4xy - 2yz + 4zx$  into canonical form by an orthogonal transformation. Discuss its nature.

Solution:

$$Q = 6x^2 + 3y^2 + 3z^2 - 4xy - 2yz + 4zx$$

$$A = \begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$$

$$\lambda^3 - C_1 \lambda^2 + C_2 \lambda - C_3 = 0 \rightarrow \textcircled{1}$$

$$C_1 = 6 + 3 + 3 = 12$$

$$C_2 = \begin{vmatrix} 6 & -2 \\ -2 & 3 \end{vmatrix} + \begin{vmatrix} 6 & 2 \\ 2 & 3 \end{vmatrix} + \begin{vmatrix} 3 & -1 \\ -1 & 3 \end{vmatrix} = 36$$

$$C_3 = \begin{vmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{vmatrix} = 32$$

$$\lambda^3 - 12\lambda^2 + 36\lambda - 32 = 0$$

$$\boxed{\lambda = 2, 2, 8}$$

$$(A - \lambda I) x = 0$$

$$\begin{pmatrix} 6-\lambda & -2 & 2 \\ -2 & 3-\lambda & -1 \\ 2 & -1 & 3-\lambda \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

Case (i) :  $\lambda = 8$

$$\begin{pmatrix} -2 & -2 & 2 \\ -2 & -5 & -1 \\ 2 & -1 & -5 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\frac{x_1}{12} = \frac{x_2}{-6} = \frac{x_3}{6}$$

$$x_1 = \begin{pmatrix} 2 \\ -1 \\ 1 \end{pmatrix}$$

Case (ii) :  $\lambda = 2$

$$\begin{pmatrix} 4 & -2 & 2 \\ -2 & 1 & -1 \\ 2 & -1 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

All the three rows are equal

$$4x_1 - 2x_2 + 2x_3 = 0$$

Put  $x_1 = 0$ ,  $-2x_2 = -2x_3$

$$\frac{x_2}{1} = \frac{x_3}{1}$$

$$\therefore x_2 = \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix}$$

The given matrix is a symmetric matrix. In this matrix, the third eigen vector  $x_3$  is orthogonal to  $x_1$  &  $x_2$ .

$$x_3^T x_1 = 0 \Rightarrow (a \ b \ c) \begin{pmatrix} 2 \\ -1 \\ 1 \end{pmatrix} = 0 \Rightarrow a - b + c = 0 \rightarrow (i)$$

$$x_3^T x_2 = 0 \Rightarrow (a \ b \ c) \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix} = 0 \Rightarrow 0a + b + c = 0 \rightarrow (ii)$$

Solving (i) & (ii),

$$x_3 = \begin{pmatrix} 1 \\ 1 \\ -1 \end{pmatrix}$$

The modal matrix is,

$$M = \begin{pmatrix} 2 & 0 & 1 \\ -1 & 1 & 1 \\ 1 & 1 & -1 \end{pmatrix}$$

The normalized matrix is,

$$N = \begin{pmatrix} 2/\sqrt{6} & 0 & 1/\sqrt{3} \\ -1/\sqrt{6} & 1/\sqrt{2} & 1/\sqrt{3} \\ 1/\sqrt{6} & 1/\sqrt{2} & -1/\sqrt{3} \end{pmatrix}$$

$$N^T A N = \begin{pmatrix} 8 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{pmatrix} = D$$

Canonical form :

$$\begin{aligned} Y^T D Y &= (y_1 \ y_2 \ y_3) \begin{pmatrix} 8 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 2 \end{pmatrix} \begin{pmatrix} y_1 \\ y_2 \\ y_3 \end{pmatrix} \\ &= 8y_1^2 + 2y_2^2 + 2y_3^2 \end{aligned}$$

Index = No. of positive square terms = 3  
(s)

Rank = No. of non-zero eigen values = 3  
(r)

Signature =  $2s - r = 6 - 3 = 3$

The quadratic form is positive definite.
