

SNS COLLEGE OF TECHNOLOGY

Vazhiampalayam, Coimbatore-35

(An Autonomous institution)

Accredited by **NBA-AICTE** and Re-Accredited by **NAAC-UGC with A+ Grade**

Approved by **AICTE**, New Delhi & Affiliated to **Anna University**, Chennai

DEPARTMENT OF CHEMISTRY

COURSE NAME : 19CHB101- CHEMISTRY FOR ENGINEERS

I YEAR / I SEMESTER

UNIT : 3. FUELS AND COMBUSTION

TOPIC : 2. SOLID FUEL-COAL- MANUFACTURE

BRAINSTORMING WITH RECAP

COAL

- Coal is a fossil fuel
- produced from large accumulation of vegetable debris / partial decompose
- modification by the action of heat & pressure over millions of years.
- Coal is a highly carbonaceous matter
- Formed under certain favorable conditions
- Alteration of vegetable matter (e.g., plants).
- In addition to noncombustible inorganic matter, it is mainly C, H, N, and O₂.

CLASSIFICATION OF COAL

- Coal is classified on the basis of its rank.
- Degree or level of maturity carbon contents.
- Based on the amount of C, O₂, and H₂ in coal.
- Coalification----- wood -----anthracite.

Wood ---- peat---- lignite---- bituminous ---- anthracite.

MANUFACTURE OF COAL BY OTTO HOFFMANN METHOD

In order to:

- (1) increase the thermal efficiency of the carbonization process, and
- (ii) recover valuable by-product (like coal gas, ammonia, benzol oil, tar, etc.),

Otto Hoffman developed modern byproduct coke oven.

MANUFACTURE OF COAL BY OTTO HOFFMANN METHOD

Construction

- The oven consists of a no. of narrow silica chambers
- Each about 10-12 m long, 3-4 m tall and 0.4-0.45 m wide.
- Each chamber has a hole at the top to introduce the charge.
- Gas off take valve
- Refractory lined cast iron door at each end for coke discharge.

Activity

MANUFACTURE OF COAL BY OTTO HOFFMANN METHOD

Working:

- Coal is fed silica chamber and closed.
- The chambers are heated to 1200°C - pre heated air & the producer gas mixture between the chambers.
- The air & gas are preheated –sending through 2nd and 3rd hot generators.
- The hot flue gases produced during combustion are pass through 1st and 4th generators until the temperature has been raised to 1000°C .
- Alternatively passed the heated hot flue gases

CARBONIZATION PROCESS

- For economical heating, the direction of inlet gases & flue gases are changed frequently.
- The cycle goes on and the heating is continued until all the volatile matter has escaped.
- It takes nearly 18 -20 hours for carbonization of a charge.
- When the carbonization is over, the red hot coke is pushed out into truck by a massive ram.
- It is then quenched by spraying water (wet quenching). The yield of coke is about 70 %.

RECOVERY OF BY-PRODUCTS

- (i) **Recovery of Tar:** The liquor ammonia is sprayed to collect tar & dust
- (ii) **Recovery of Ammonia:** The water is sprayed to collect NH_3 as NH_4OH
- (iii) **Recovery of Naphthalene:** The cold water is sprayed, naphthalene gets condensed.
- (iv) **Recovery of Benzene:** Petroleum is sprayed, benzene gets condensed to liquid.
- (v) **Recovery of H_2S :** The remaining gases are passed to purifier packed with moist Fe_2O_3 , H_2S is retained.

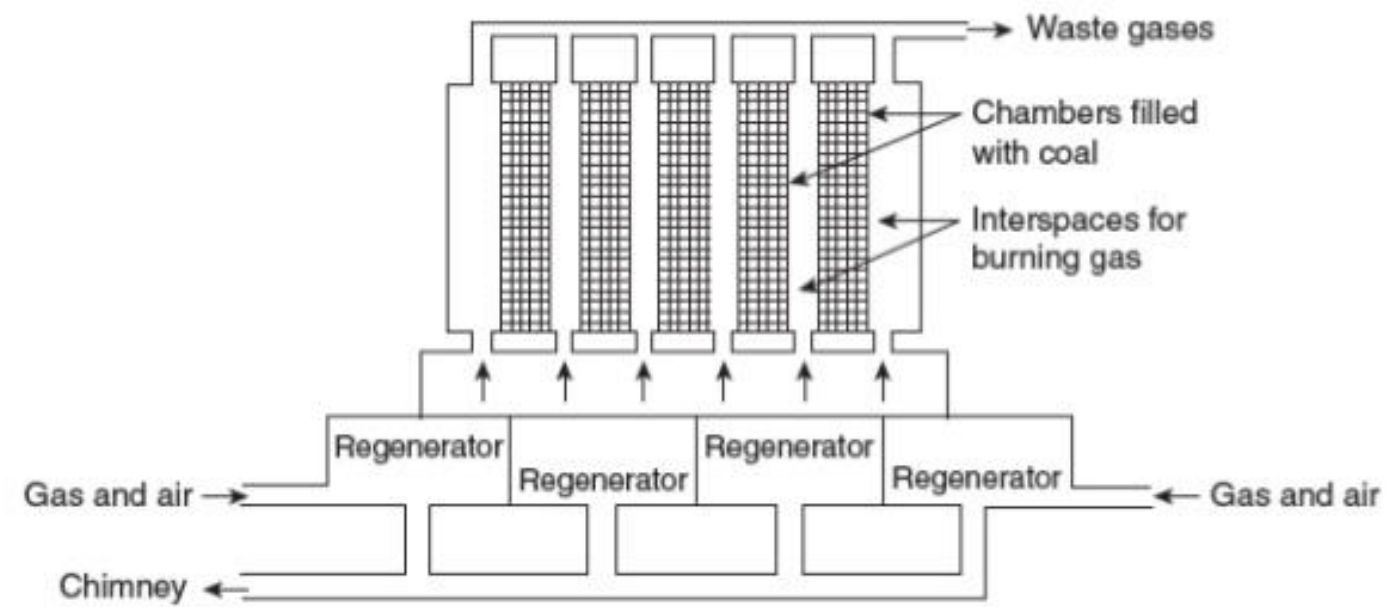

ADVANTAGES

Otto-Hoffmann or Byproduct Oven

Engineering Chemistry (revised edition)

ISBN: 978-81-265-4475-2

Copyright©2014 Wiley India Pvt. Ltd. All Rights Reserved

WILEY

Advantages of this method

- Valuable by products are recovered.
- It requires less time.
- Heating is done externally by producer gas.
- Flue gas produced during carbonization is also used to preheat the coal.

ASSESSMENT

- 1. Draw the Otto -Haffmann Oven to recover Valuable by products**
- 2. List the recovered by products from the carbonization process**
