

# Unit I - Introduction

Purpose of Database System - Views of data – Data models, Database Management system - Three-schema architecture of DBMS, Components of DBMS. **Entity – Relationship Model - Conceptual data modelling - motivation**, entities, entity types, attributes, relationships, relationship types, E/R diagram notations, Examples

# Recap

- **Data Modelling** - process of creating a data model for the data to be stored in a database.
- Two Types
  - ER
  - UML

# Design Phases

- Initial phase -- characterize fully the data needs of the prospective database users.
- Second phase -- choosing a data model
- Final Phase -- Moving from an abstract data model to the implementation of the database
  - Logical Design - Deciding on the database schema.
    - **Redundancy**
    - **Incompleteness**
  - Physical Design - Deciding on the physical layout of the database

# Conceptual data modelling

- **Conceptual Data Model**

- Organized view of database concepts and their relationships.
- The purpose of creating a conceptual data model is to establish entities, their attributes, and relationships.

# Design Approaches

- Entity Relationship Model
  - Models an enterprise as **a collection of *entities* and *relationships***
    - Entity: a “thing” or “object”
      - Described by a set of *attributes*
    - Relationship: an association among several entities
  - Represented diagrammatically by an ***entity-relationship diagram***

# Entity Relationship Model

- Represents the overall logical structure of a database.
- The ER data model employs three basic concepts:
  - **Entity:** A real-world thing
  - **Attribute:** Characteristics or properties of an entity
  - **Relationship:** Dependency or association between two entities

# Entity Sets

- An **entity** is an object that exists and is distinguishable from other objects.
  - Example: specific person, company, event, plant
- An **entity set** is a set of entities of the same type that share the same properties.
  - Example: set of all persons, companies, trees, holidays
- An entity is represented by a **set of attributes**; i.e., descriptive properties possessed by all members of an entity set.
  - Example:

***instructor = (ID, name, salary )***

***course = (course\_id, title, credits)***

- **primary key** - uniquely identifying each member of the set.

# Entity Sets -- *instructor* and *student*

76766	Crick
45565	Katz
10101	Srinivasan
98345	Kim
76543	Singh
22222	Einstein

*instructor*

98988	Tanaka
12345	Shankar
00128	Zhang
76543	Brown
76653	Aoi
23121	Chavez
44553	Peltier

*student*

# Representing Entity sets in ER Diagram

- Entity sets can be represented graphically as follows:
  - Rectangles represent entity sets.
  - Attributes listed inside entity rectangle
  - Underline indicates primary key attributes

# Relationship Sets

- A **relationship** is an association among several entities

### Example:

44553 (Peltier)  
*student* entity

advisor  
relationship set

22222 (Einstein)  
*instructor* entity

- A **relationship set** is a mathematical relation among  $n \geq 2$  entities, each taken from entity sets

$$\{(e_1, e_2, \dots, e_n) \mid e_1 \in E_1, e_2 \in E_2, \dots, e_n \in E_n\}$$

where  $(e_1, e_2, \dots, e_n)$  is a relationship

- Example:

$$(44553, 22222) \in \text{advisor}$$

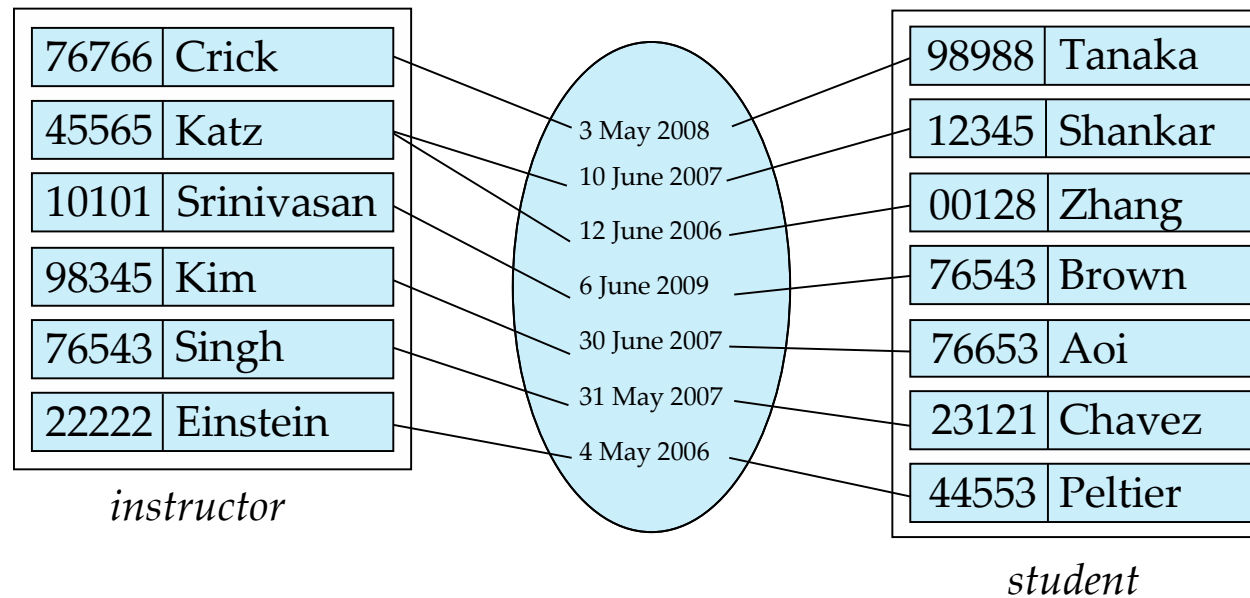

# Representing Relationship Sets via ER Diagrams

- Diamonds represent relationship sets.

# Relationship Sets

- An attribute can also be associated with a relationship set

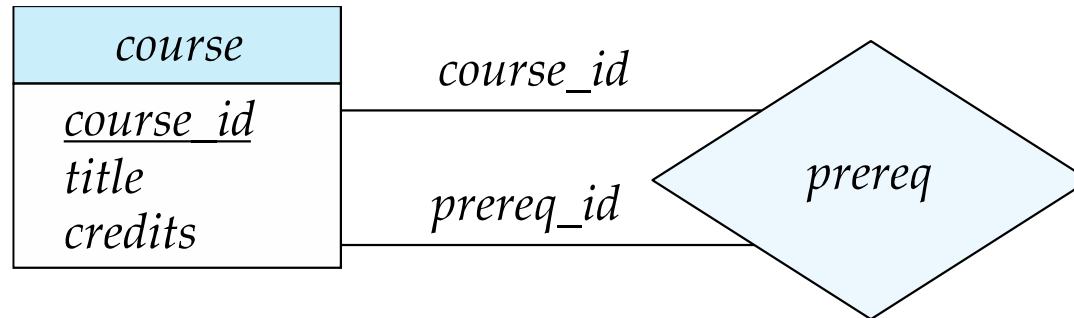

# Relationship Sets with Attributes

# Roles

- Entity sets of a relationship need not be distinct

# Degree of a Relationship Set

- Binary relationship
  - involve two entity sets (or degree two).
  - most relationship sets in a database system are binary.
  - Example: *students* work on research *projects* under the guidance of an *instructor*.
  - relationship *proj\_guide* is a ternary relationship between *instructor*, *student*, and *project*

Non-binary Relationship Sets

# E-R Diagram with a Ternary Relationship

# Attributes

- Attribute types:
  - **Simple** and **composite** attributes.
    - **Composite Attributes**- further divide into more simple attributes.
    - Student Roll Number, Employee id, Account balance, Salary, Account number, and Aadhar number are an **example of simple attributes**.
  - **Complex Attributes** - Name and Address
  - **Single-valued** and **multivalued** attributes
    - **Example: multivalued attribute: *phone\_numbers***
  - **Derived** attributes
    - Can be computed from other attributes
    - **Example: age, given date\_of\_birth**
  - **Domain** – the set of permitted values for each attribute

# Composite Attributes

composite  
attributes

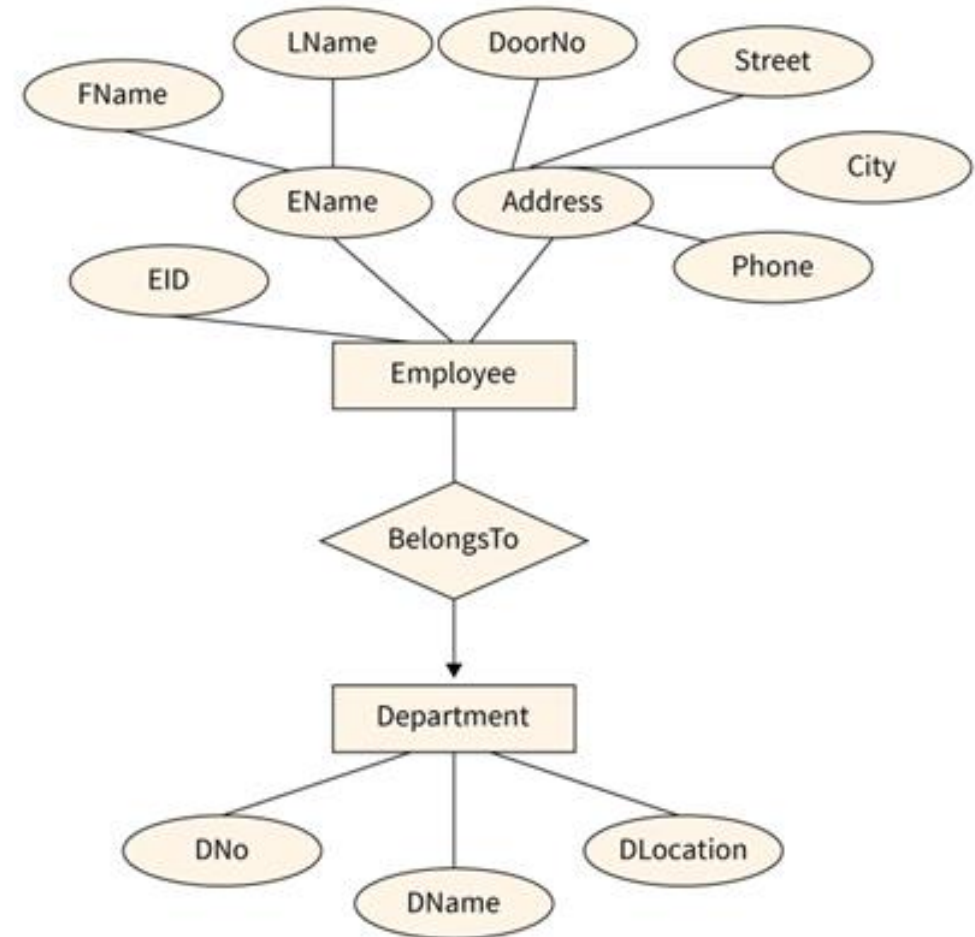

component  
attributes

street_number
street_name
apt_number
city
state
zip
{ phone_number }
date_of_birth
age ( )

# Mapping Cardinality Constraints

- Express the number of entities to which another entity can be associated via a relationship set.
- For a binary relationship set the mapping cardinality must be one of the following types,
  - **One to one**
  - **One to many**
  - **Many to one**
  - **Many to many**

# Mapping Cardinality

(a)

One to one

(b)

One to many

(a)

Many to one

(b)

Many to many

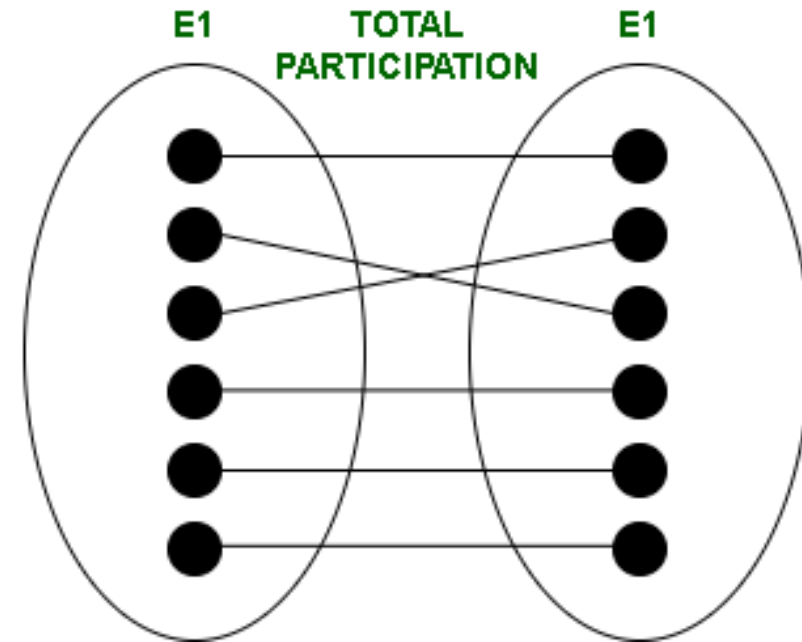

# Representing Cardinality Constraints in ER Diagram

- cardinality constraints by drawing either a
  - directed line ( $\rightarrow$ ), signifying “one,”
  - an undirected line ( $-$ ), signifying “many,” between the relationship set and the entity set.

# Total and Partial Participation

# Total and Partial Participation

## Total Participation

## Partial Participation

# Notation for Expressing More Complex Constraints

- A line may have an associated minimum and maximum cardinality (l,h)
- where  $l$  is the minimum and  $h$  the maximum cardinality
  - A minimum value of 1 indicates total participation.
  - A maximum value of 1 indicates that the entity participates in at most one relationship
  - A maximum value of \* indicates no limit.

Instructor can advise 0 or more students. A student must have 1 advisor; cannot have multiple advisors
