

# UNIT I

# MATHEMATICAL MODELLING OF SYSTEMS

# INTRODUCTION

- The control systems can be represented with a set of mathematical equations known as mathematical model. These models are useful for analysis and design of control systems.
- The following mathematical models are mostly used.
  - Differential equation model
  - Transfer function model
  - State space model

# TRANSFER FUNCTION

- Transfer function model is an s-domain mathematical model of control systems.
- The Transfer function of a Linear Time Invariant (LTI) system is defined as the ratio of Laplace transform of output and Laplace transform of input by assuming all the initial conditions are zero.

# MECHANICAL SYSTEMS

- Mechanical systems mainly consists of three main elements namely **mass, dashpot and spring.**
- If a force is applied to a translational mechanical system, then it is opposed by opposing forces due to mass, elasticity and friction of the system.
- Since the applied force and the opposing forces are in opposite directions, the algebraic sum of the forces acting on the system is zero

# MECHANICAL SYSTEM

- **Mass:**

$$F_m \propto a$$

$$F_m = M_a = M \frac{d^2x}{dt^2}$$

$$F = F_m = M \frac{d^2x}{dt^2}$$

Where,

**F** is the applied force

**F<sub>m</sub>** is the opposing force due to mass

**M** is mass

**a** is acceleration

**x** is displacement

# MECHANICAL SYSTEM

- **Spring:**

$$F \propto x$$

$$F_k = Kx$$

$$F = F_k = Kx$$

Where,

**F** is the applied force

**F<sub>k</sub>** is the opposing force  
due to elasticity of  
spring

**K** is spring constant

**x** is displacement

# MECHANICAL SYSTEM

- **Dashpot:**

$$F_b \propto v$$

$$F_b = Bv = B \frac{dx}{dt}$$

$$F = F_b = B \frac{dx}{dt}$$

Where,

$F_b$  is the opposing force due to friction of dashpot

$B$  is the frictional coefficient

$v$  is velocity

$x$  is displacement

# ELECTRICAL SYSTEM

- The basic elements of electrical system are **resistor, inductor and capacitor.**

(1).   $V(t) = R i(t) ; i(t) = \frac{V(t)}{R}.$

(2).   $V(t) = L \frac{di(t)}{dt} ; i(t) = \frac{1}{L} \int v(t) dt.$

(3).   $V(t) = \frac{1}{C} \int i(t) dt ; i(t) = C \frac{d}{dt} V(t).$
