

Need for Secondary Reference Electrode

- It is very difficult to maintain the H^+ ion concentration at 1 M and hydrogen gas pressure at 1 atm.
- Platinum electrode is poisoned by the presence of impurities in the solution or gas.

Calomel Electrode or Secondary Reference Electrode

Secondary electrode or calomel electrode

To overcome the limitations of hydrogen electrode, the calomel electrode is developed. This is called the secondary reference electrode. It consists of a glass tube. Pure mercury is placed at the bottom of the tube and is covered with a paste of mercurous chloride. The remaining portion of the tube is filled with a saturated solution of KCl. The bottom of the tube is sealed with a platinum wire (Fig. 2.4).

If the electrode acts as anode, the reaction is

Mercury undergo oxidation to produce mercurous ion (Hg_2^{2+}) and combines with chloride ion to give mercurous chloride (Hg_2Cl_2). Hence, the concentration of chloride ions is decreased.

Calomel electrode the electrode acts as cathode, the reaction is

The mercurous ion present in the mercurous chloride undergoes reduction to give mercury. Hence the concentration of chloride ions is increased. Calomel electrode is represented by
 $\text{Hg} | \text{Hg}_2\text{Cl}_2(s), \text{KCl} (\text{sat. solution})$.

Characteristics of Calomel Electrode

(An Autonomous Institution)

Coimbatore-641035.

1) The electrode potential of calomel electrode depends on the activity of the chloride ions. When the concentration of chloride ion decreases, the electrode potential of calomel Electrode increases. The single electrode potential of calomel electrode with various concentration of KCl on the hydrogen scale at 298 K are given below

$$0.1 \text{ N KCl} = 0.3338 \text{ V}$$

$$1 \text{ N KCl} = 0.2800 \text{ V}$$

$$\text{Saturated KCl} = 0.2422 \text{ V}$$
