

Biodiversity:

All different kinds of life, you will find in one area which makes a healthy environment.

Why's threats ?

- * Climate change
- * Deforestation
- * Pollution are the factors for threats to biodiversity.

Threats faced by biodiversity.

- * Habitat loss
- * Species Overexploitation
- * Climate change
- * Deforestation
- * Environmental degradation
- * Habitat fragmentation
- * Wildlife trade
- * Chytridiomycosis
- * Invasive species

Habitat Loss:

Habitat Loss or are habitat destruction is the process by which natural habitat becomes incapable of supporting its organisms and making it difficult to survive.

Species Overexploitation

The act of using something especially a natural resources.

Overexploitation are alternatively, over harvesting can lead to the destruction of the resource, that is all natural resource.

eg: Wildplants

Climate change:

Climate change is generally defined as significant variations of average conditions.

Causes :

- * Generating power.
- * Manufacturing goods.
- * Cutting down forest.

Effects :

- * Hotter temperatures.
severe
- * More Storms.
- * Increased drought.

iv)

Deforestation :

Deforestation can be defined as the large scale, removal of trees from forest for the facilitation of human activities.

It damages the natural habitat, disturbances in the water cycle and erosions. It is also a contributor to climate change and global warming.

v)

Environmental degradation :

The deterioration of the environment through depletion of resources, such as air, water and soil. ~~the air~~

vi)

Habitat fragmentation :

Habitat fragmentation occurs larger areas of habitat are split into separate smaller areas. It affects by reducing the amount of suitable habitat available for organisms.

vii)

Wildlife :

Wildlife trade is any ~~scale~~ exchange of wild animal and plant resources by people. It refers to the products that are derived from non-domestic^{at} animals or plants usually extracted for human needs.
