UNIT - IV FUNCTIONS OF SEVERAL VARIABLES

METHOD OF LAGRANGIAN'S MULTIPLIERS

We can find an extreme value of the function f(x,y,3) subject to the constrained y(x,y,3)=0

Define $F(x,y,z) = \int (x,y,z) + \lambda g(x,y,z)$ where λ is an undetermined constant called the Lagrangian multipliers.

By solving the egn.

That an + by + Cz = P

Let $J = n^2 + y^2 + z^2$ and g = an + by + cz - p F(n,y,z) = J(n,y,z) + Jg(n,y,z) $= n^2 + y^2 + z^2 + J[an + by + cz - p]$
