Miller Indices

Introduction:

Crystals are made up of large no. of parallel -
Equidistant planes, passing through the lattice points
called lattice planes.

The \perp^{th} distance b/w any two adjacent plane
is called Interplanar distance (d).

Definition:

Miller indices are the 3 smallest possible integers
which have the same ratio as the reciprocals of the
Intercepts of the plane concerned along the 3 axes.

Procedure:

1. Find the intercepts along the 3 axis
2. Find the coefficient of the intercepts i.e. 3, 6, 2
3. Find the reciprocal of these no $\frac{1}{3}, \frac{1}{6}, \frac{1}{2}$
4. Convert these reciprocal to whole no by (x) by
reciprocal with their LCM

$$6 \times \frac{1}{3}, 6 \times \frac{1}{6}, 6 \times \frac{1}{2} \Rightarrow 2 \ 6 \ 3$$

5. Enclose these no in bracket ().

Points to ponder:

- 1) It should be enclosed in bracket $\rightarrow ()$
- 2) There should not be any comma in b/w the nos
- 3) IF the plane (263) means it should be read
as two six three & not as two hundred sixty three.

d spacing in cubic lattice

d spacing is the distance b/w any two successive plane

Consider a cubic crystal with 'a' as length of its cube edge & a plane ABC as shown in figure. This plane belongs to a family of planes whose Miller indices are (hkl)

The \perp line ON from the origin of the cube to the plane ABC represents interplanar spacing (d) of this family.

$$OA \text{ along } ox = \frac{a}{h}$$

$$OB \text{ along } oy = \frac{a}{k}$$

$$OC \text{ along } oz = \frac{a}{l}$$

$$OA:OB:OC = \frac{1}{h} : \frac{1}{k} : \frac{1}{l}$$
$$= \frac{a}{h} : \frac{a}{k} : \frac{a}{l}$$

$$\cos \alpha' = \frac{ON}{OA} = \frac{d}{\frac{a}{h}} = \frac{dh}{a}$$

$$\cos \beta' = \frac{ON}{OB} = \frac{d}{\frac{a}{k}} = \frac{dk}{a}$$

$$\cos \gamma' = \frac{ON}{OC} = \frac{d}{\frac{a}{l}} = \frac{dl}{a}$$

$$\cos^2 \alpha' + \cos^2 \beta' + \cos^2 \gamma' = 1$$

$$\left(\frac{dh}{a}\right)^2 + \left(\frac{dk}{a}\right)^2 + \left(\frac{dl}{a}\right)^2 = 1$$

$$\frac{d^2}{a^2} (h^2 + k^2 + l^2) = 1$$

$$d^2 = \frac{a^2}{h^2 + k^2 + l^2}$$

$$d = \frac{a}{\sqrt{h^2 + k^2 + l^2}}$$
