SCSS

Course: **Mobile Application Development**

Unit : V – IONIC Framework

Class / Semester: II MCA / III Semester

Introduction

- ❑ Syntactically Cascading Style Sheet is the superset of CSS.
- ❑ Due to its advanced features it is often termed as Sassy CSS. SCSS have file extension of .scss
- ❑ provides the CSS friendly syntax to closing the gap between Sass and CSS
- ❑ It is fully CSS compatible. You can rename a CSS file as .scss extension and it will also work.
- ❑ SCSS helps you to customize Bootstrap
- ❑ This language is a preprocessor one, and we need to compile or interrupt it into the CSS language

SASS ([Syntactically awesome style sheets](#)) is the older version, one of the major differences in writing these two is the **use of semicolons and brackets**

Why Angular JS?

- ❑ SCSS offers variables, you can shorten your code by using variables

In CSS	In SCSS
<pre>Body { color: #ffffff; font: \$ubuntu-font: 'Ubuntu', 'Arial', 'Helvetica', sans-serif; font-size: xx-large; padding: 2rem; }</pre>	<pre>\$white: #ffffff; \$ubuntu-font: 'Ubuntu', 'Arial', 'Helvetica', sans-serif; Body { color: \$white; font: \$ubuntu-font; font-size: xx-large; padding: 2rem; }</pre>

Single Page Application

SCSS	SASS
<ul style="list-style-type: none"><input type="checkbox"/> Semicolon and bracket syntax<input type="checkbox"/> Superset of CSS<input type="checkbox"/> Newer and recommended	<ul style="list-style-type: none"><input type="checkbox"/> No Semicolon and bracket syntax<input type="checkbox"/> HAML style indention<input type="checkbox"/> Less characters to type<input type="checkbox"/> Enforced conventions

SASS

```
$txt-size: 12px  
$txt-color: #333  
$link-color: #999
```

```
#main  
  font-size: $txt-size  
  color: $txt-color  
  a  
    color: $link-color
```

SCSS

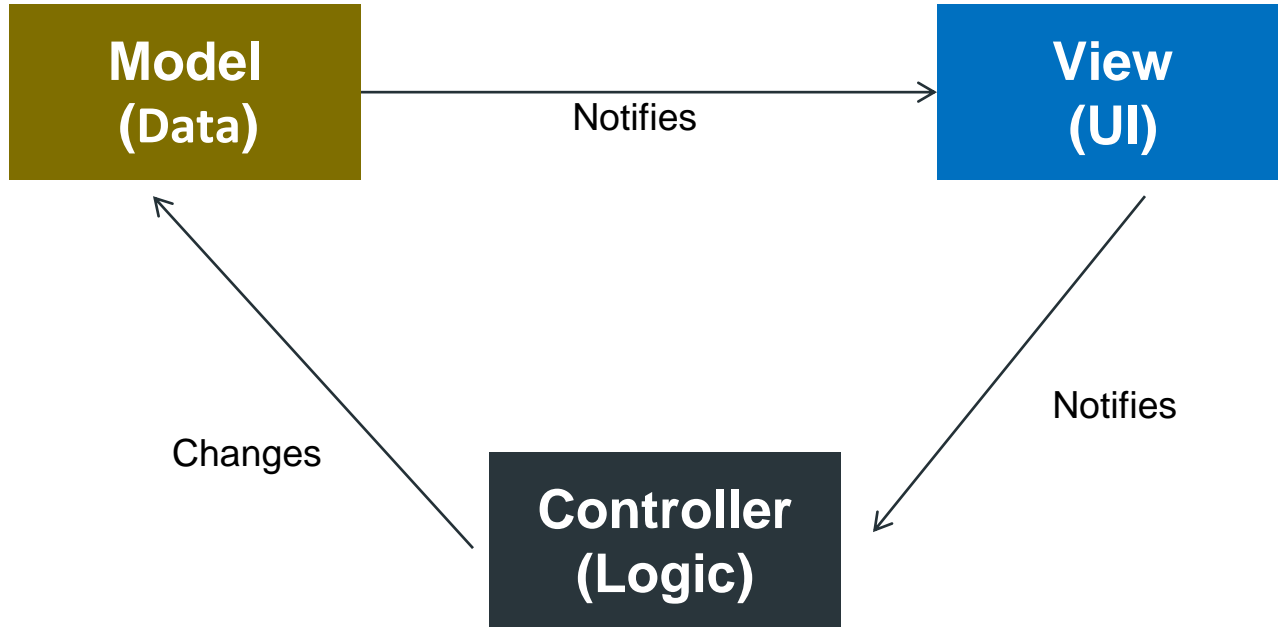

```
$txt-size: 12px;  
$txt-color: #333;  
$link-color: #999;
```

```
#main{  
  font-size: $txt-size;  
  color: $txt-color;  
  a{  
    color: $link-color;  
  }  
}
```

Features

- assists a user in adding various extra features to the CSS, such as nesting, variables, etc.
- extra features make the process of writing the SCSS language quicker and easier as compared to that of writing the standard language of CSS
- SCSS language may make use of the CSS function and code
- Directives, Modules, Expressions, filters, – Extend HTML
- MVC
- Dependency Injection
- Testing
- Server-Side Communication

MVC

MVC

The diagram illustrates the mapping of MVC components to JavaScript concepts. At the top center, a dark blue rounded rectangle contains the text 'MVC'. Below this, three olive green rectangular boxes are stacked vertically, labeled 'Model', 'View', and 'Controller' from top to bottom. To the right of these, three dark blue rectangular boxes are stacked vertically, labeled 'JS Objects', 'DOM', and 'JS Classes' from top to bottom. Three horizontal arrows point from the 'Model' box to the 'JS Objects' box, from the 'View' box to the 'DOM' box, and from the 'Controller' box to the 'JS Classes' box. The background features a large yellow triangle on the right side and a dark blue triangle in the top-left corner.

Angular JS

- ❑ It extends HTML with new attributes
- ❑ perfect for Single Page Applications
- ❑ AngularJS is a JavaScript framework written in JavaScript.

```
<script src="https://ajax.googleapis.com/ajax/libs/angularjs/1.6.9/angular.min.js"></script>
```

- ❑ AngularJS starts automatically when the web page has loaded

Example

```
<!DOCTYPE html>
<html>

<script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.6.9/angular.min.js"></script>

<body>

<div ng-app="">
  <p>Input something in the input box:</p>
  <p>Name: <input type="text" ng-model="name"></p>
  <p ng-bind="name"></p>
</div>
</body>
</html>
```

- ❑ AngularJS directives are HTML attributes with an ng prefix
- ❑ **ng-app** directive defines an AngularJS application.
- ❑ **ng-model** directive binds the value of HTML controls (input, select, textarea) to application data.
- ❑ **ng-bind** directive binds application data to the HTML view.

Expressions

- ❑ AngularJS expressions are written inside double braces: **{{ expression }}**
- ❑ It can also be written inside a directive: `ng-bind="expression"`
- ❑ AngularJS will "output" data exactly where the expression is written

```
<body>
```

```
<div ng-app="">
```

```
<p>My first expression: {{ 5 + 5 }}</p>
```

```
</div>
```

```
</body>
```

Modules

- ❑ AngularJS modules define AngularJS applications.
- ❑ AngularJS controllers control AngularJS applications.
- ❑ The **ng-app** directive defines the application, the **ng-controller** directive defines the controller.
