COURSE NAME : 23CAT602 - DATA STRUCTURES & ALGORITHMS

I YEAR/ I SEMESTER

UNIT – III SORTING & SEARCHING
Topic: Linear Searching

Ms.B.Sumathi

Assistant Professor

Department of Computer Science and Engineering

Linear Search is defined as a sequential search algorithm that starts at one end and goes through each element of a list until the desired element is found, otherwise the search continues till the end of the data set.

Department of Computer Application/ 23CAT602 / DSA / Unit -III / Sorting & Searching / B.Sumathi, AP/ MCA

How Does Linear Search Algorithm Work?

In Linear Search Algorithm,
Every element is considered as a potential match for the key and checked for the same.
If any element is found equal to the key, the search is successful and the index of that element is returned.
If no element is found equal to the key, the search yields "No match found".

For example: Consider the array **arr[] = {10, 50, 30, 70, 80, 20, 90, 40}** and **key** = 30

Step 1: Start from the first element (index 0) and compare **key** with each element (arr[i]).

✓Comparing key with first element arr[0]. SInce not equal, the iterator moves to the next element as a potential match.

✓Comparing key with next element arr[1]. SInce not equal, the iterator moves to the next element as a potential match.

Step 2: Now when comparing arr[2] with key, the value matches. So the Linear Search Algorithm will yield a successful message and return the index of the element when key is found (here 2).

Complexity Analysis of Linear Search:

Time Complexity:

✓**Best Case:** In the best case, the key might be present at the first index. So the best case complexity is O(1)

✓**Worst Case:** In the worst case, the key might be present at the last index i.e., opposite to the end from which the search has started in the list. So the worst-case complexity is O(N) where N is the size of the list.

✓**Average Case:** O(N)

Auxiliary Space: O(1) as except for the variable to iterate through the list, no other variable is used.

Advantages of Linear Search:

✓Linear search can be used irrespective of whether the array is sorted or not. It can be used on arrays of any data type.
✓Does not require any additional memory.
✓It is a well-suited algorithm for small datasets.

Drawbacks of Linear Search:

✓Linear search has a time complexity of O(N), which in turn makes it slow for large datasets.

✓Not suitable for large arrays.

When to use Linear Search?

✓When we are dealing with a small dataset.
✓When you are searching for a dataset stored in contiguous memory.

THANK YOU
