**Find the area of the triangle formed by the vertices (4, 5), (10, 12) and (-3, 2)**

**Solution:**

The area of the triangle having its vertices as P(x<sub>1</sub>, y<sub>1</sub>), Q(x<sub>2</sub>, y<sub>2</sub>) and R(x<sub>3</sub>, y<sub>3</sub>) is given by

$$\frac{1}{2} [x_1(y_2 - y_3) + x_2(y_3 - y_1) + x_3(y_1 - y_2)]$$

$$= \frac{1}{2} [4(12 - 2) + 10(2 - 5) + (-3)(5 - 12)]$$

$$= \frac{1}{2} [(4 \times 10) + (10 \times -3) + (-3)(-7)]$$

$$= \frac{1}{2} [40 - 30 + 21] = 15.5$$

Find the distance of the point A (5, -5) from the origin.

The Distance from Origin (0,0) can be calculated using Distance formula.

$$\rightarrow \sqrt{(0 - (-5))^2 + 0 - (-5))^2}$$

$$= \sqrt{5^2 + 5^2} = \sqrt{50}$$

$$= 5\sqrt{2} \text{ units}$$

If the points A(2, 3), B(5, K) and C(6, 7) are collinear, then k = ?

Solution:

Given 3 points A(2,3), B(5,k) and C(6,7) which are collinear we have to find the value of k.

Points are collinear if the slopes of any two pairs are equal.

$$\text{Slope of AB} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{k - 3}{5 - 2}$$

$$\text{Slope of BC} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{7 - k}{6 - 5}$$

$$\text{As lines are collinear slopes are equal} \Rightarrow \frac{k - 3}{5 - 2} = \frac{7 - k}{6 - 5}$$

$$\Rightarrow k - 3 = 2(7 - k) \Rightarrow 4k = 21 + 3$$

$$\Rightarrow k = 6 \text{ The value of k is 6.}$$

**Which of the following is not an odd function?**

$$f(x) = -x^3$$

$$f(x) = x^5$$

$$f(x) = x^2 - x$$

$$f(x) = |x|^3$$

**Concept: Odd and Even Functions**

**Solution:**

An odd function is a function whose value reverses in sign for a reversal in sign of its argument. i.e.  $f(x) = -f(-x)$ .

Except  $f(x) = |x|^3$  all other functions mentioned in the choices change values.

**Find the nth term for the AP: 11, 17, 23, 29, ...**

**Solution:**

Here,  $a = 11$ ,  $d = 17 - 11 = 23 - 17 = 29 - 23 = 6$  We know that nth term of an AP is  $a + (n - 1) d \Rightarrow$  nth term for the given AP  $= 11 + (n - 1) 6 \Rightarrow$  nth term for the given AP  $= 5 + 6 n$  We can verify the answer by putting values of 'n'.  $\Rightarrow n = 1 \rightarrow$  First term  $= 5 + 6 = 11 \Rightarrow n = 2 \rightarrow$  Second term  $= 5 + 12 = 17 \Rightarrow n = 3 \rightarrow$  Third term  $= 5 + 18 = 23$  and so on ...

**Q2: Find the sum of the AP in the above question till the first 10 terms.**

**Solution :**

From the above question,  $\Rightarrow$  nth term for the given AP  $= 5 + 6 n \Rightarrow$  First term  $= 5 + 6 = 11 \Rightarrow$  Tenth term  $= 5 + 60 = 65 \Rightarrow$  Sum of 10 terms of the AP  $= 0.5 n$  (first term + last term)  $= 0.5 \times 10 (11 + 65) \Rightarrow$  Sum of 10 terms of the AP  $= 5 \times 76 = 380$
