Continuous Random Variable :

A random variable 'X' is called a continuous random variable if it takes all possible values in a given interval.

Examples : Age, Height and Weight Distribution function (or) Cumulative Distribution function of the random Variable X :

The C.D.F of a Continuous random variable X is defined as,

$$F(x) = P(x \le x) = \int_{-\infty}^{x} f(x) dt dx$$

Probability Density function: (P.D.f)

Let X be a Continuous random Variable. The function f(X) is called the p.d.f of the random Variable X if it satisfies the following Conditions:

Ь

(i) $f(x) \ge 0$, $-\infty \ge x \ge \infty$ (ii) $\int_{-\infty}^{\infty} f(x) dx = 1$

Remark:

1.
$$P(a \ge x \le b) = P(a \le x \le b) = \int_{a}^{\infty} f(x) dx$$

2. $P(x \ge a) = \int_{a}^{\infty} f(x) dx$
3. $P(x \ge a) = \int_{a}^{a} f(x) dx$
 $-\infty$
4. $P(x \ge a | x \ge b) = \frac{P(x \ge a)}{P(x \ge a)}$

(+) If 'x' is a Continuous random Variable whose p.d.f is given by, $f(x) = \begin{cases} c(4x - ax^2), 0 \le x \le a \\ 0, \text{ otherwise} \end{cases}$ Find (a) What is the value of 'c'? (b) Find P(x >1) Solution : (a) Given: $f(x) = \begin{cases} c(4x - 2x^2), 0 < x < 2 \\ 0, 0 \end{cases}$, otherwise $\int f(x) dx = 1$ $\int C(4x-ax^2) dx = 1$ $C \int 4 \frac{\chi^2}{2} - 2 \frac{\chi^3}{3} \int d = 1$ $C \left[2^{2} \left(2^{2} \right) - \frac{2}{2} \left(2^{3} \right) \right] = 1$ $C\left[\frac{8-\frac{16}{3}}{3}\right]=1 \implies C\left(\frac{24-16}{3}\right)=1$ $C\left(\frac{8}{3}\right) = 1$ $C = \frac{3}{8}$ Put $C = \frac{3}{2}$ in (1), $f(x) = \begin{cases} \frac{3}{8} (4x - 2x^2), & 0 < x < 2 \\ 0, & 0 \end{cases}$

(b) $P(x > i) = \int_{1}^{\infty} f(x) dx$ $= \int_{1}^{2} f(x) dx + \int_{2}^{\infty} f(x) dx$ $= \int_{1}^{2} \frac{3}{8} (4x - 2x^{2}) dx + 0$ $= \frac{3}{8} \times 2 \int_{1}^{2} (2x - x^{2}) dx$ $= \frac{3}{4} \left[2 \frac{x^{2}}{2} - \frac{x^{3}}{3} \right]_{1}^{2}$ $= \frac{3}{4} \left[(4 - i) - \frac{1}{5} (8 - i) \right]$ $= \frac{3}{4} \left[3 - \frac{7}{3} \right] = \frac{3}{4} \left[\frac{9 - 7}{5} \right] = \frac{2}{4} = \frac{1}{2}$ $P(x > i) = \frac{1}{2}$

5 The amount of time, in hours, that a Computer functions A before breaking down is a Continuous random Variable with Probability density function given by,

$$f(x) = \int \lambda e^{-\chi/100}, \ \chi \ge 0$$

What is the probability that (a) a Computer will function between 50 and 150 hrs, before breaking down (b) it will function less than 500 hours.

DEPARTMENT OF MATHEMATICS

Solution:
Given:
$$f(x) = \begin{cases} \lambda e^{-x/100} & x \ge 0 \\ 0 & y \ge 0 \end{cases} \longrightarrow 0$$

Since $f(x)$ is a p.d.f of 'x',

$$\int_{-\infty}^{\infty} f(x) dx = i$$

$$\int_{-\infty}^{0} f(x) dx + \int_{0}^{\infty} f(x) dx = i$$

$$\int_{-\infty}^{0} f(x) dx + \int_{0}^{\infty} f(x) dx = i$$

$$\int_{-\infty}^{0} \frac{e^{-x/100}}{1} \int_{0}^{\infty} = i$$

$$\lambda \left(-\frac{100}{1} \right) \left[e^{-\infty} - e^{0} \right] = i$$

$$\lambda (-100) \left[e^{-\infty} - e^{0} \right] = i$$

$$\frac{\lambda (-100) \left[e^{-1} \right] = i}{\left[\frac{\lambda - \frac{1}{100}}{10} \right]}$$
(a) We know that,

$$P(a \le x \le b) = \int_{0}^{b} f(x) dx$$

$$P(50 \le x \le 150) = \int_{50}^{150} f(x) dx$$

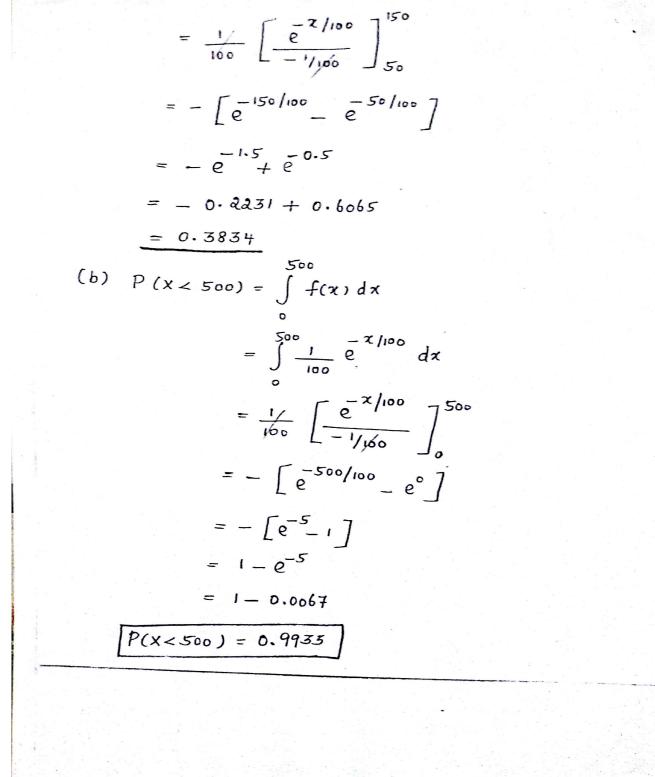

$$= \int_{50}^{150} \frac{e^{-x/100}}{100} dx$$
