**An Autonomous Institution**  
**Coimbatore-35**

Accredited by NBA – AICTE and Accredited by NAAC – UGC with ‘A++’ Grade  
Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

## **DEPARTMENT OF ELECTRONICS & COMMUNICATION ENGINEERING**

### **MICROPROCESSORS AND MICROCONTROLLERS**

II YEAR/ IV SEMESTER

#### **UNIT 1 – 8085 AND 8086 ARCHITECTURE**

TOPIC – Addressing modes of 8086

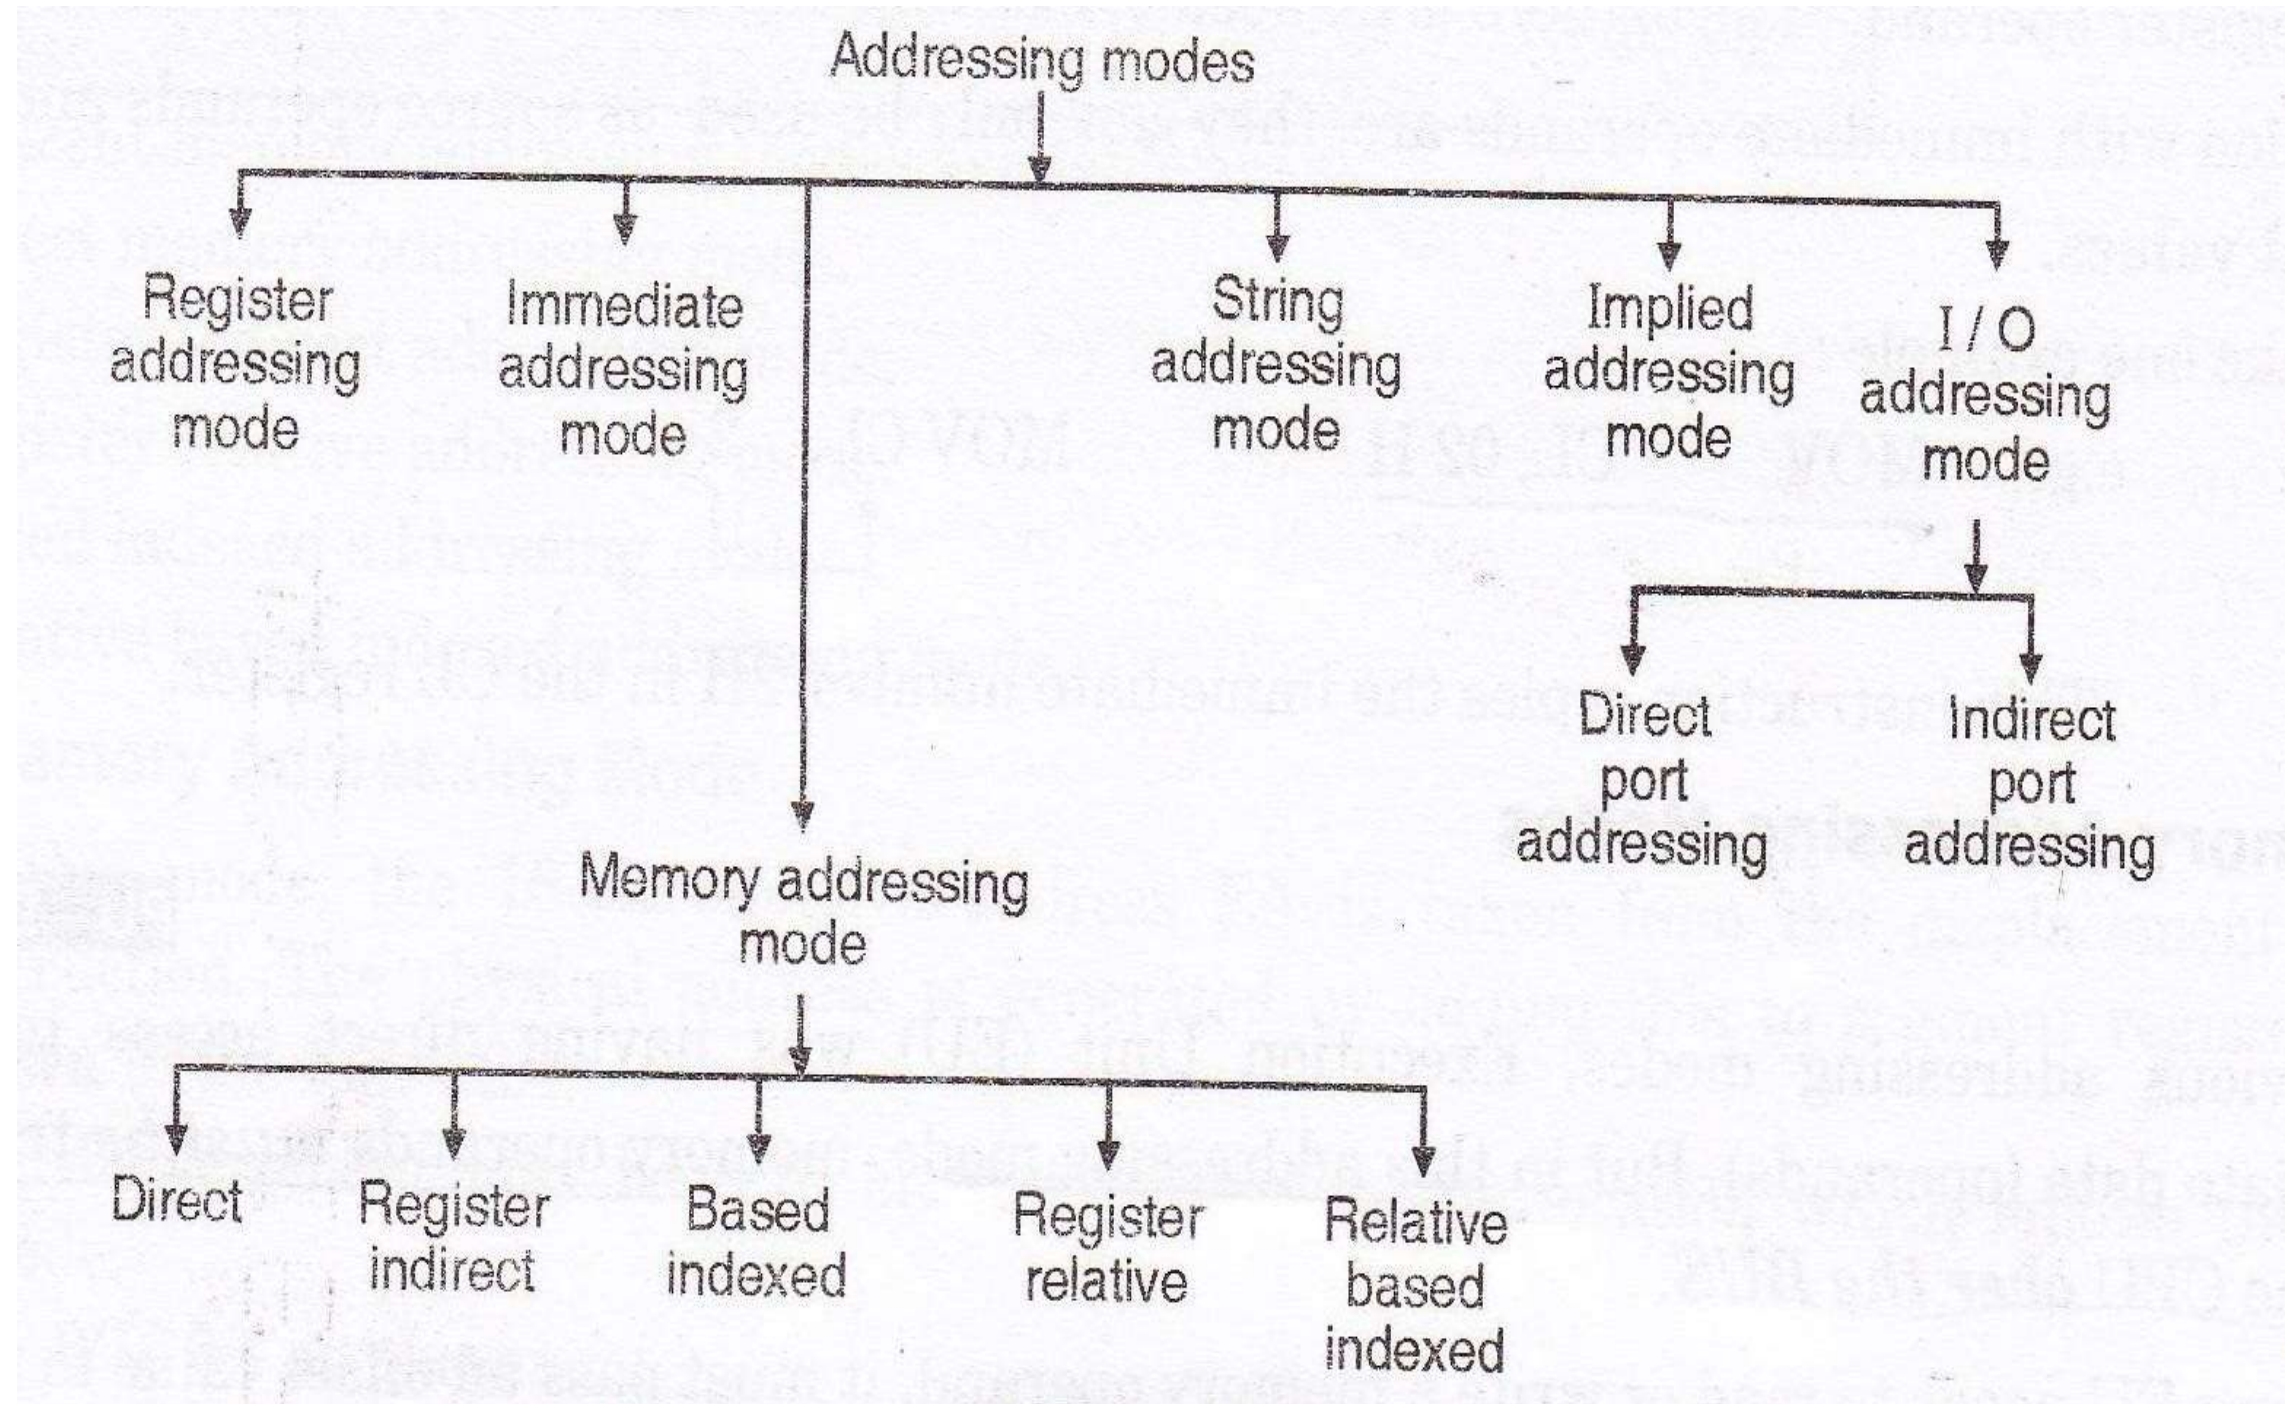

# ADDRESSING MODES OF 8086

1. Register Addressing Mode
2. Immediate Addressing Mode
3. Memory Addressing Mode
4. String Addressing Mode
5. I/ OAddressingMode
6. Implied Addressing Mode

# ADDRESSING MODES OF 8086

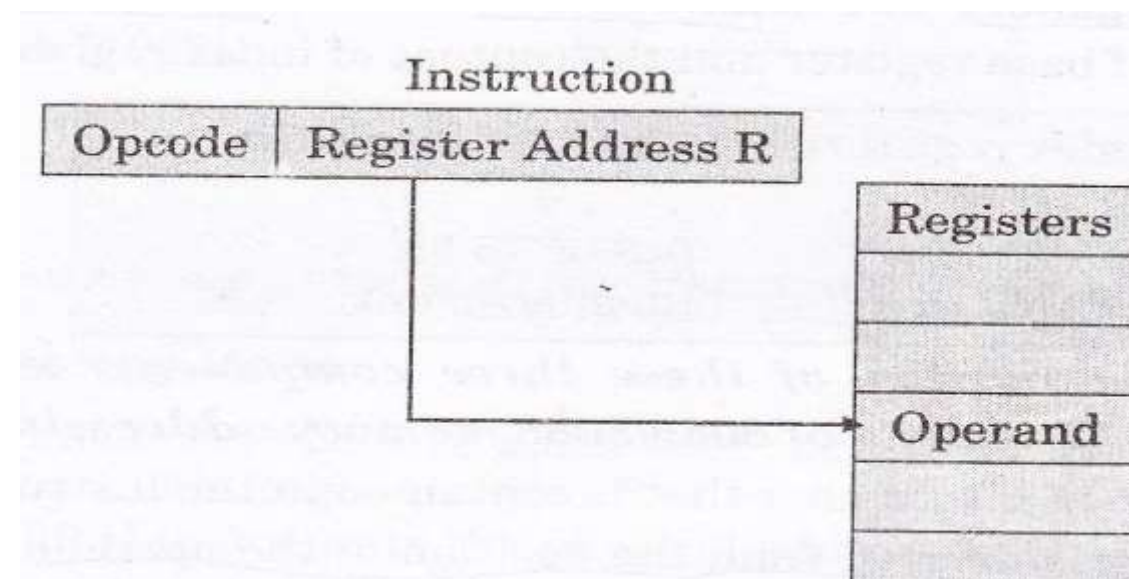

## ADDRESSING MODES OF 8086

- Data is in register and Instruction Specifies the particular register
- E.g

MOV AX, BX

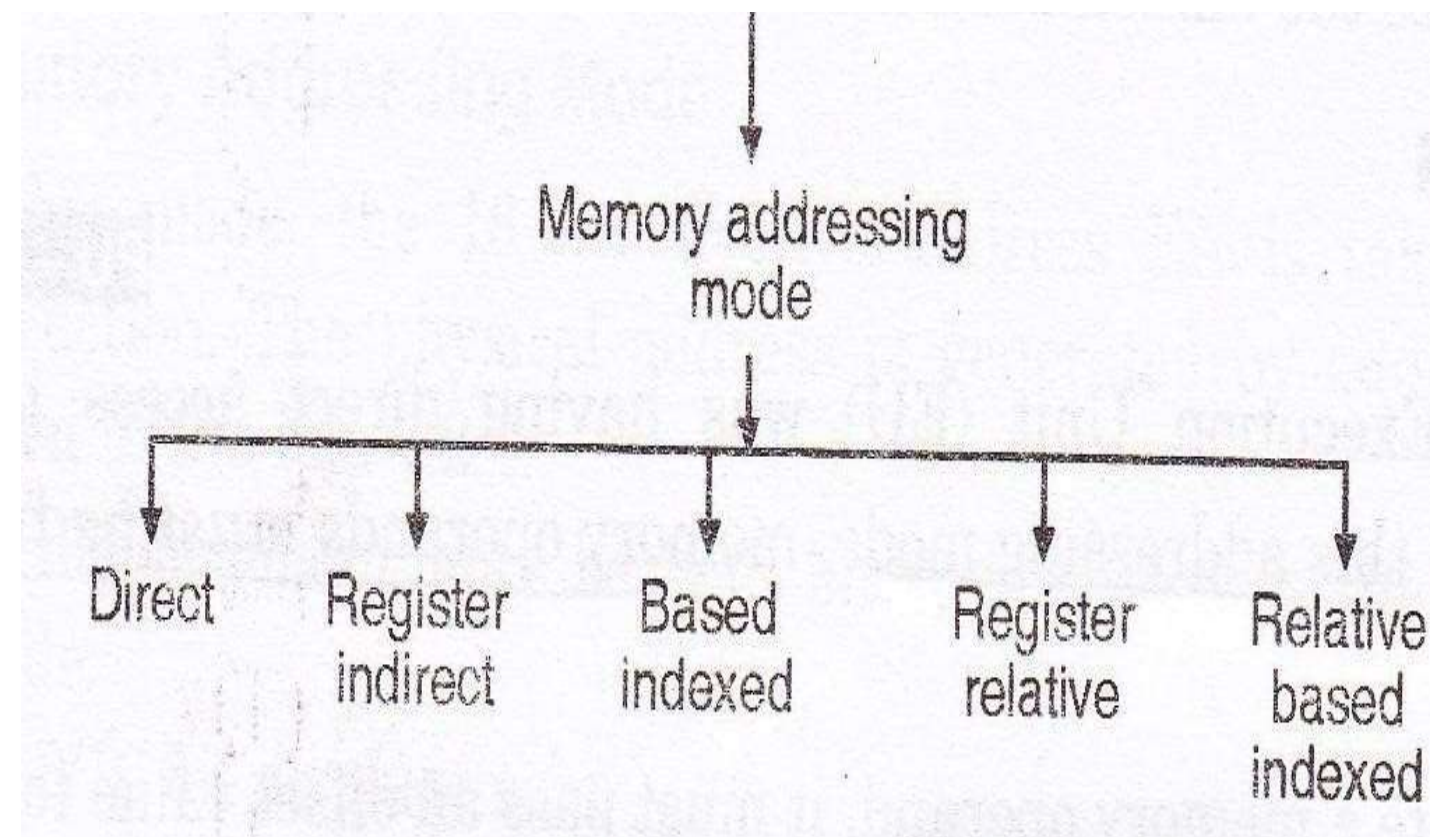

## IMMEDIATE ADDRESSING MODE

- Immediate operand is *Constant* data contained in an *Instruction*
- *i.e.* The source operand is a part of instruction instade of register memory
- E.g

MOV CL,02H

## EFFECTIVE ADDRESS

- The *offset of a memory operand* is called the operand's effective address (EA).
- Is an *unsigned 16 bit no*. That expresses the *operands distance* in byte from the *beginning of the segment*
- 8086 has Base register and Index register
- So EU calculates EA by summing a *Displacement, Content of Base register and Content of Index register*.

$$\begin{aligned} \underline{EA} &= \{\text{Base register}\} + \{\text{Index register}\} + \{8 \text{ or } 16 \text{ bit displacement}\} \\ &= \begin{Bmatrix} \text{BX} \\ \text{BP} \end{Bmatrix} + \begin{Bmatrix} \text{SI} \\ \text{DI} \end{Bmatrix} + \{8 \text{ or } 16 \text{ bit displacement}\} \end{aligned}$$

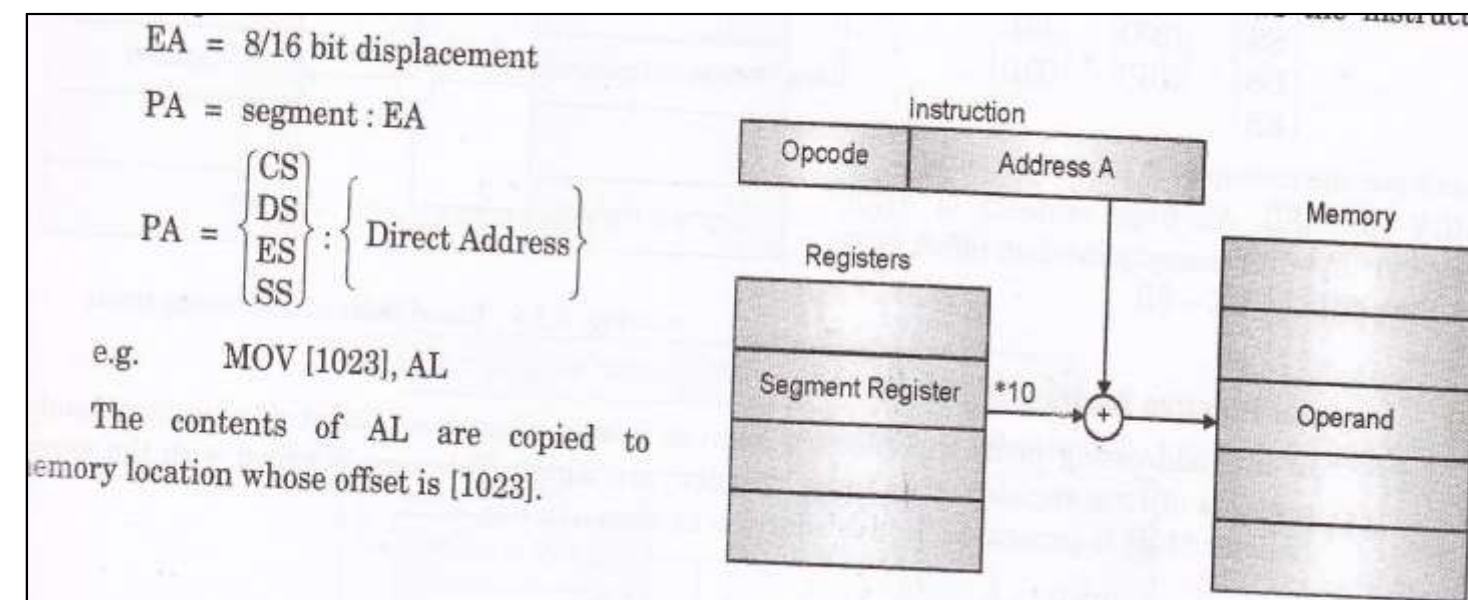

## INSTRUCTION SET OF 8085

EA is taken from the *displacement field* of instruction.

PA = This addr. Is added with Seg.Reg $\times$ 10H

MOV[1023],AL

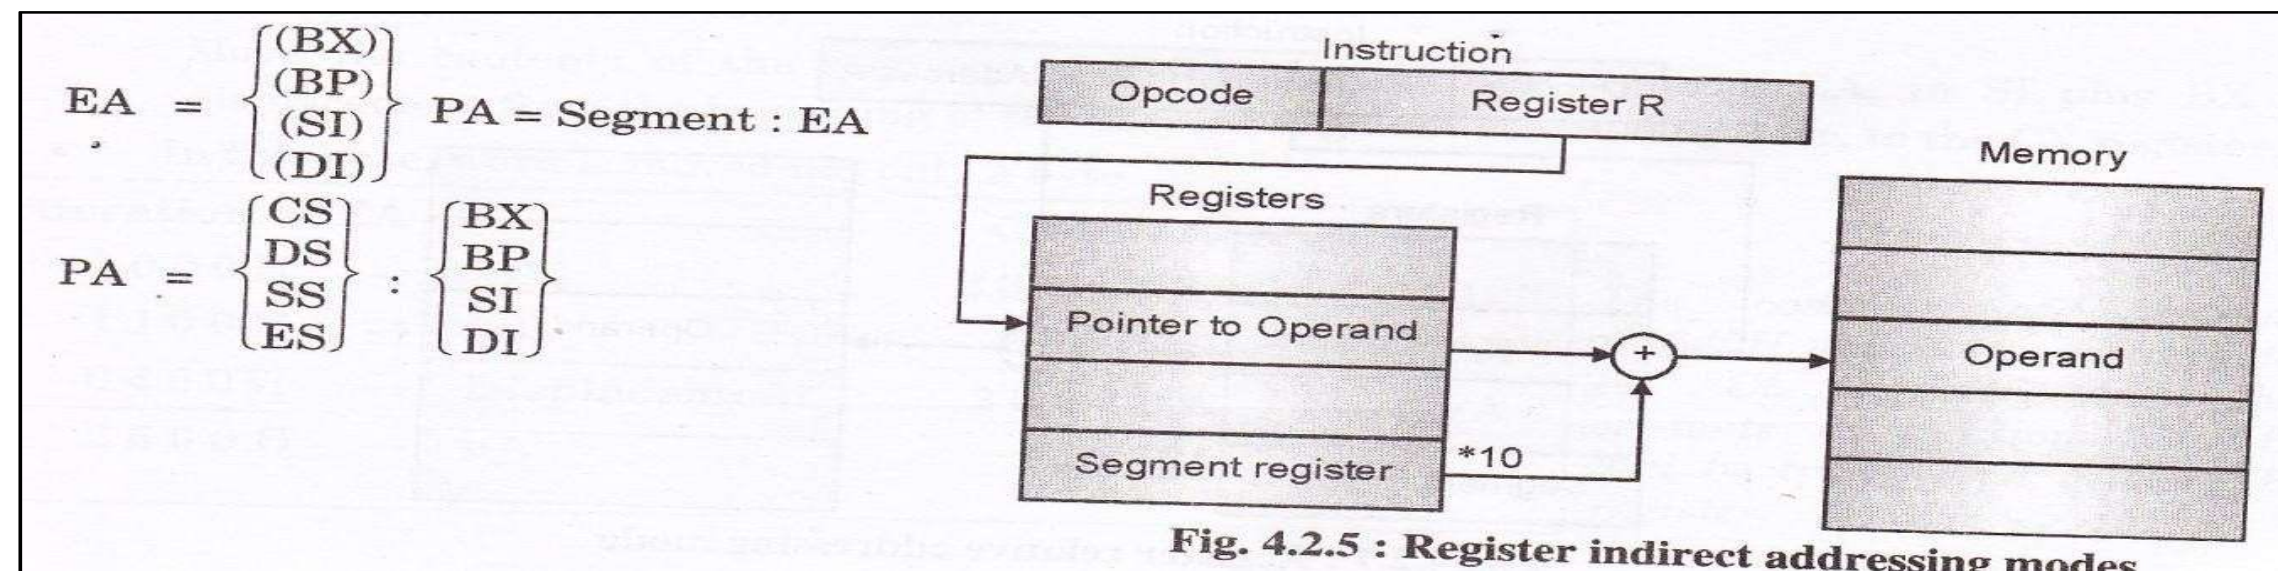

## REGISTER INDIRECT ADDRESSING MODE

EA of may be taken directly from *one of the base register or index register*.

PA = This addr. Is added with Seg.Reg $\times 10H$

MOV [SI], AL

## BASED INDEXED ADDRESSING MODE

### 3) Based Indexed Addressing Mode

- In this addressing mode, the EA is sum of a base register and an index register, both of which are specified by the instruction. The sum is added to the segment register \* 10 H to give effective address as shown in Fig. 4.2.6.

$$\begin{aligned} \therefore EA &= \{\text{Base register}\} + \{\text{Index register}\} \\ &= \begin{Bmatrix} (BX) \\ (BP) \end{Bmatrix} + \begin{Bmatrix} (SI) \\ (DI) \end{Bmatrix} \end{aligned}$$

$$\begin{aligned} PA &= \text{Segment register} : EA \\ &= \begin{Bmatrix} CS \\ SS \\ DS \\ ES \end{Bmatrix} : \begin{Bmatrix} (BX) \\ (BP) \end{Bmatrix} + \begin{Bmatrix} (SI) \\ (DI) \end{Bmatrix} \end{aligned}$$

Let's see one example, to clear the concept.  
MOV [BX] [SI], AL Copy contents of AL register (byte) to memory location offset is in [BX] [SI] i.e. [BX + SI].

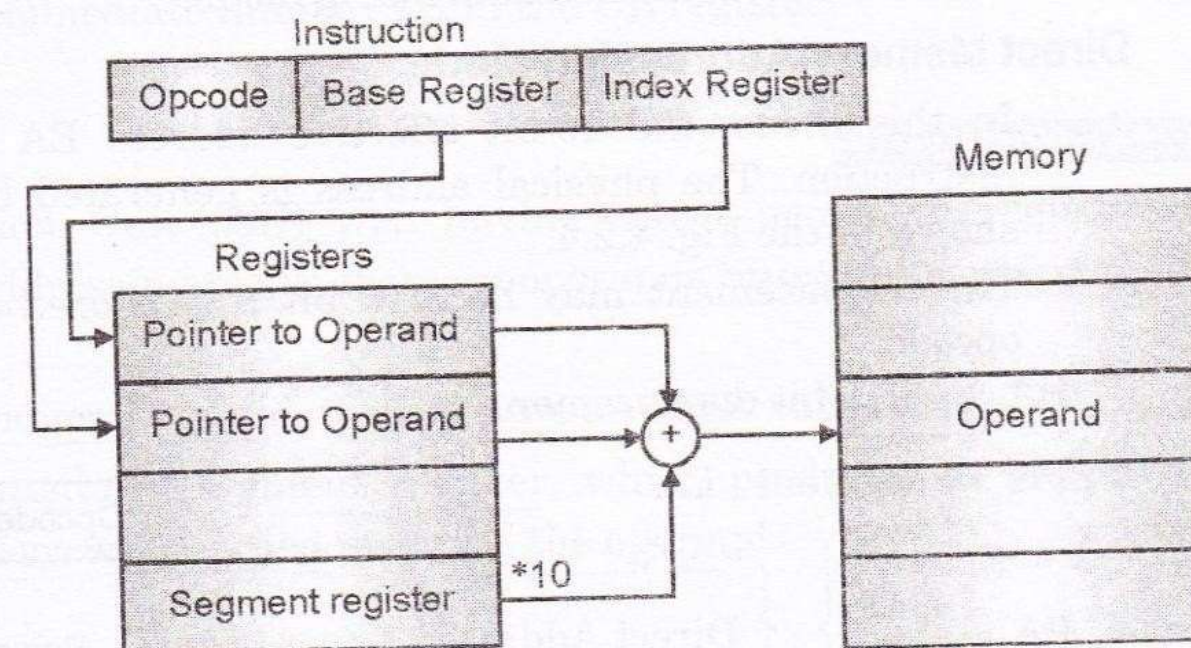

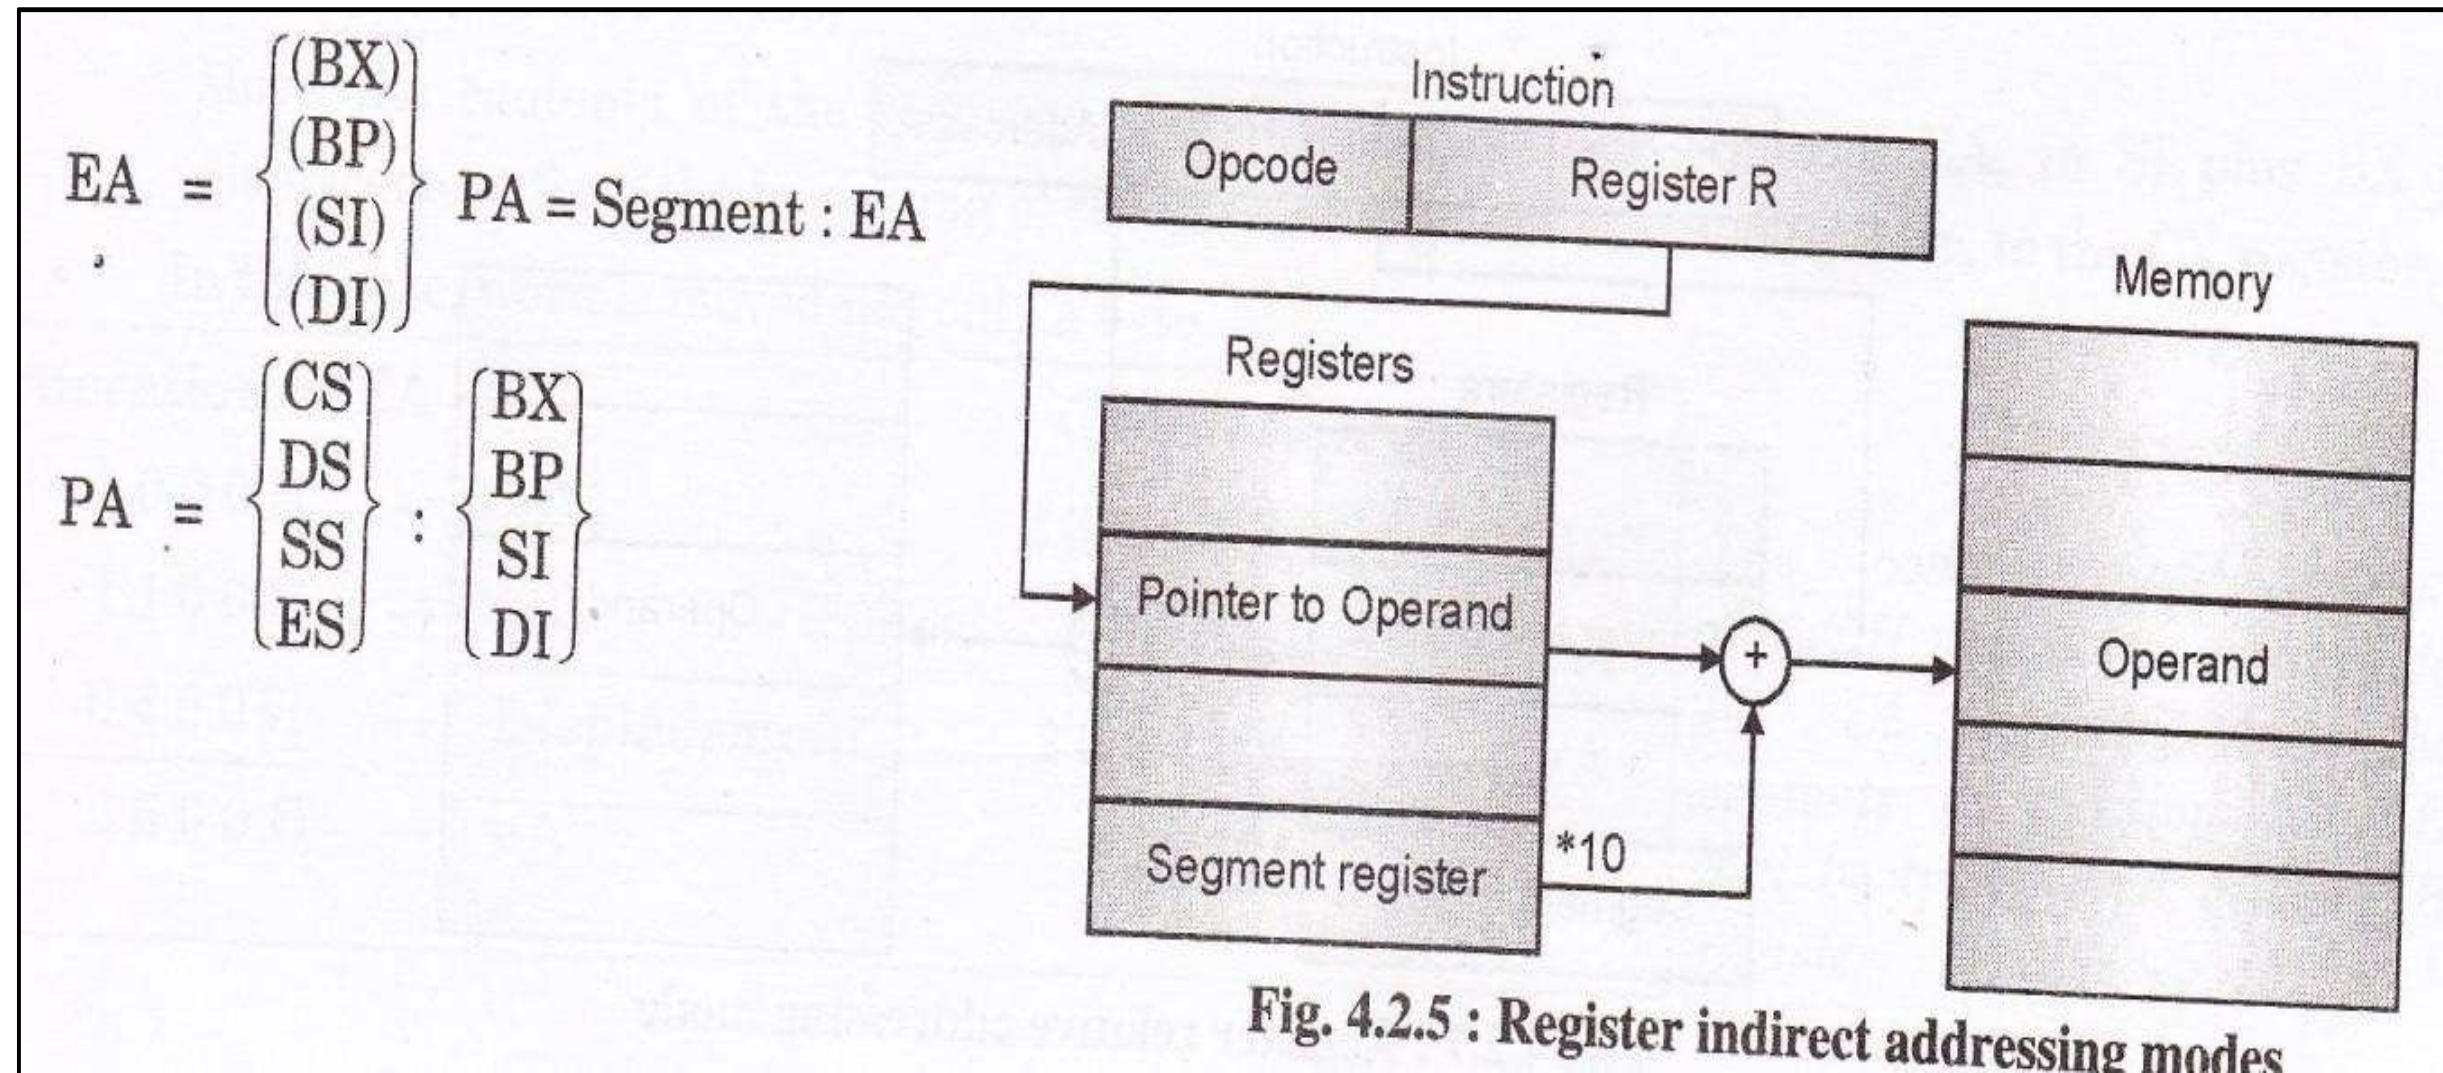

Fig. 4.2.6 : Based indexed addressing mode
