

**DEPARTMENT OF MATHEMATICS**

GAUSS - JACOBI METHOD

(28)

① Solve the following system of equations by using Gauss-Jacobi method.

$$10x + 2y + z = 9 \rightarrow \textcircled{1}$$

$$x + 10y - z = -22 \rightarrow \textcircled{2}$$

$$-2x + 3y + 10z = 22 \rightarrow \textcircled{3}$$

Solution:

Since the given system of equations is diagonally dominant, we write the equations as,

$$x = \frac{1}{10} (9 - 2y - z) \rightarrow \textcircled{4}$$

$$y = \frac{1}{10} (-22 - x + z) \rightarrow \textcircled{5}$$

$$z = \frac{1}{10} (22 + 2x - 3y) \rightarrow \textcircled{6}$$

First iteration:

Putting  $x=0$ ,  $y=0$  &  $z=0$  in  $\textcircled{4}$ ,  $\textcircled{5}$  &  $\textcircled{6}$

$$x = \frac{9}{10} = 0.9$$

$$y = \frac{-22}{10} = -2.2$$

$$z = \frac{22}{10} = 2.2$$

Second iteration:

Putting  $x=0.9$ ,  $y=-2.2$ ,  $z=2.2$  in  $\textcircled{4}$ ,

$\textcircled{5}$  &  $\textcircled{6}$ ,

$$x = \frac{1}{10} (9 + 2 \times 2.2 - 2.2) = 1.12$$

$$y = \frac{1}{10} (-22 - 0.9 + 2.2) = -2.07$$

$$z = \frac{1}{10} (22 + 2 \times 0.9 + 3 \times 2.2) = 3.04$$

**DEPARTMENT OF MATHEMATICS**

Third iteration:

$$x = \frac{1}{10} (9 + 2 \times 2.07 - 3.04) = 1.01$$

$$y = \frac{1}{10} (-22 - 1.12 + 3.04) = -2.008$$

$$z = \frac{1}{10} (22 + 2 \times 1.12 + 3 \times 2.07) = 3.045$$

Fourth iteration:

$$x = \frac{1}{10} (9 + 2 \times 2.008 - 3.045) = 0.9971$$

$$y = \frac{1}{10} (-22 - 1.01 + 3.045) = -1.9965$$

$$z = \frac{1}{10} (22 + 2 \times 1.01 + 3 \times 2.008) = 3.0044$$

Fifth iteration:

$$x = \frac{1}{10} (9 + 2 \times 1.9965 - 3.0044) = 0.9989$$

$$y = \frac{1}{10} (-22 - 0.9971 + 3.0044) = -1.9993$$

$$z = \frac{1}{10} (22 + 2 \times 0.9971 + 3 \times 1.9965) = 2.9984$$

Sixth iteration:

$$x = \frac{1}{10} (9 + 2 \times 1.9993 - 2.9984) = 1$$

$$y = \frac{1}{10} (-22 - 0.9989 + 2.9984) = -2$$

$$z = \frac{1}{10} (22 + 2 \times 0.9989 + 3 \times 1.9993) = 2.9996$$

Seventh iteration:

$$x = \frac{1}{10} (9 + 4 - 2.9996) = 1$$

$$y = \frac{1}{10} (-22 - 1 + 2.9996) = -2$$

## DEPARTMENT OF MATHEMATICS

$$z = \frac{1}{10} (22 + 2 + 6) = 3$$

(29)

∴ The required solution is

$$\boxed{x = 1, y = -2, z = 3}$$

(2) Solve the following system of equations, correct to 3 decimal places, using Gauss-Jacobi method.

$$-x + y + 10z = 35.61$$

$$x + 10y + z = 20.08$$

$$10x + y - z = 11.19$$

Solution:

Since the given system of equations is not diagonally dominant, we rewrite the equations as,

$$10x + y - z = 11.19 \rightarrow (1)$$

$$x + 10y + z = 20.08 \rightarrow (2)$$

$$-x + y + 10z = 35.61 \rightarrow (3)$$

Hence we have,

$$x = \frac{1}{10} (11.19 - y + z) \rightarrow (4)$$

$$y = \frac{1}{10} (20.08 - x - z) \rightarrow (5)$$

$$z = \frac{1}{10} (35.61 + x - y) \rightarrow (6)$$

First iteration:

Putting  $x = 0, y = 0, z = 0$  in (4), (5) & (6),

$$x = \frac{11.19}{10} = 1.119$$

$$y = \frac{20.08}{10} = 2.008$$

$$z = \frac{35.61}{10} = 3.561$$

**DEPARTMENT OF MATHEMATICS**

Second iteration:

$$x = \frac{1}{10} (11.19 - 2.008 + 3.561) = 1.274$$

$$y = \frac{1}{10} (20.08 - 1.119 - 3.561) = 1.54$$

$$z = \frac{1}{10} (35.61 + 1.119 - 2.008) = 3.472$$

Third iteration:

$$x = \frac{1}{10} (11.19 - 1.54 + 3.472) = 1.312$$

$$y = \frac{1}{10} (20.08 - 1.274 - 3.472) = 1.533$$

$$z = \frac{1}{10} (35.61 + 1.274 - 1.54) = 3.534$$

Fourth iteration:

$$x = \frac{1}{10} (11.19 - 1.533 + 3.534) = 1.319$$

$$y = \frac{1}{10} (20.08 - 1.312 - 3.534) = 1.523$$

$$z = \frac{1}{10} (35.61 + 1.312 - 1.533) = 3.539$$

Fifth iteration:

$$x = \frac{1}{10} (11.19 - 1.523 + 3.539) = 1.321$$

$$y = \frac{1}{10} (20.08 - 1.319 - 3.539) = 1.522$$

$$z = \frac{1}{10} (35.61 + 1.319 - 1.523) = 3.539$$

Hence

$$x = 1.321, y = 1.522, z = 3.539$$
