2. Testing of Significance for difference of proportions:

Suppose a large samples of sizes n, and no are taken respectively from 2 different populations. Let X, be the number of persons possessing the attribute A in the first sample and let X2 be the number of persons possessing the same attribute in the second sample. Then the sample proportions are given by,

$$b_1 = \frac{X_1}{n_1}, \quad b_2 = \frac{X_2}{n_2}$$

Under the null hypothesis $H_0: P_1 = P_2 = P$ (hence $Q_{V_1} = Q_{V_2} = Q_V$) test statistic will be,

$$Z = \frac{\beta_1 - \beta_2}{\int PO_V\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}$$

Where the population Proportion $P = \frac{n_1 p_1 + n_2 p_2}{n_1 + n_2}$

Problems :

1) A machine produced 20 defective articles in a batch of 400. After overhauling it produced 10 defectives in a batch of 300. Has the machine improved?

Solution:

Given:
$$n_1 = 400$$
, $n_2 = 300$

Proportion of defectives in the
$$b_1 = \frac{20}{400} = 0.05$$

Proportion of defectives in the
$$b_2 = \frac{10}{300} = 0.0333$$

second Sample

$$P = \frac{n_1 p_1 + n_2 p_2}{n_1 + n_2}$$

$$= 400 \times 20 + 300 \times 10$$

$$400 + 300$$

$$=\frac{30}{700}=0.043$$

$$P = 0.043$$

$$Q_r = 1 - P = 0.957$$

(An Autonomous Institution)

DEPARTMENT OF MATHEMATICS

Null hypothesis: Ho: There is no significant difference in the machine before and after overhauling.

i.e , Ho : P, = P2

Alternative hypothesis: H,: P, > P2 (Right-tailed test)

Level of Significance: Let $\alpha = 5$. Then $Z_{\alpha} = 1.645$

Test Statistic:

$$Z = \frac{p_1 - p_2}{\sqrt{p_0 \left(\frac{1}{n_1} + \frac{1}{n_2}\right)}}$$

$$Z = \frac{0.05 - 0.0333}{\sqrt{0.043 \times 0.957 \left(\frac{1}{400} + \frac{1}{300}\right)}}$$

Decision:

Since |Z| Z Z, Ho is accepted . The

machine has not improved after overhauling.

In a sample of boo men from a certain city, 450 men are found to be smokers. In a sample of 900 from another city 450 are found to be smokers. Do the data indicate that the two cities are significantly different w.r.t prevalence of smoking habit among men?

Solution:

Given:
$$n_1 = 600$$
, $n_2 = 900$

Proportion of smokers in
$$p_1 = \frac{450}{600} = 0.75$$

Proportion of Smokers in
$$p_2 = \frac{450}{900} = 0.5$$

the second city

$$P = \frac{n_1 p_1 + n_2 p_2}{n_1 + n_2}$$

$$= \frac{600 \times 0.75 + 900 \times 0.5}{600 + 900}$$

$$=\frac{900}{1500}=0.6$$

$$\theta_r = 1 - P$$
$$= 1 - 0.6$$

(An Autonomous Institution)

DEPARTMENT OF MATHEMATICS

Null hypothesis: Ho: There is no Significant difference between the two Cities w.r.t the prevalence of smoking habit among them.

i.e.,
$$H_0$$
: $P_1 = P_2$

Alt Hyp: H,: P, + P2 (Two-tailed test)

Level of significance: Let & = 5 %.

Test - Statistic :

$$Z = P_1 - P_2$$

$$\sqrt{PQ \left(\frac{1}{n_1} + \frac{1}{n_2}\right)}$$

$$Z = 0.75 - 0.5$$

$$\sqrt{0.6 \times 0.4 \left(\frac{1}{600} + \frac{1}{900}\right)}$$

$$= 0.25$$

$$0.026$$

$$= 9.62$$

Decision:

Since |z| > 3, Ho is rejected.

.: There is a significant difference between the two cities w.r.t the prevalence of smoking habit among them.
