An Autonomous Institution
Coimbatore-35

Accredited by NBA – AICTE and Accredited by NAAC – UGC with ‘A+’ Grade
Approved by AICTE, New Delhi & Affiliated to Anna University, Chennai

DEPARTMENT OF ELECTRONICS & COMMUNICATION ENGINEERING

19ECB212 – DIGITAL SIGNAL PROCESSING

II YEAR/ IV SEMESTER

UNIT 3 – FIR FILTER DESIGN

TOPIC – FIR Filter Design using Windowing Techniques

WINDOWING TECHNIQUES OF FIR FILTERS

- The windows are finite duration sequences used to modify the impulse response of the FIR filters in order to reduce the ripples in the pass band and stop band and also to achieve the desired transition from pass band and stop band
- The FIR filter design starts with desired frequency response $H_d(e^{j\omega})$. The desired impulse response $h_d(n)$ is obtained by taking inverse Fourier transform of $H_d(e^{j\omega})$. The desired impulse response will be an infinite duration sequence

WINDOWING TECHNIQUES OF FIR FILTERS

- On multiplying finite duration window sequence with infinite duration impulse response with modified sample, which is used to design FIR filter
- The different types of window sequences are
 1. Rectangular Window, $W_R(n)$
 2. Hanning Window, $W_C(n)$
 3. Hamming Window, $W_H(n)$
 4. Blackman Window, $W_B(n)$

RECTANGULAR WINDOW

Characteristic Features:

1. The main-lobe width is equal to $4\pi / N$
2. The maximum side-lobe magnitude is -13dB
3. The side-lobe magnitude doesnot decrease significantly with increasing ω

Features of FIR filter design using rectangular window:

1. The width of the transition region is related to the width of the main-lobe of window spectrum
2. Gibbs oscillations are noticed in the pass band and stop band
3. The attenuation in the stop band is constant and cannot be varied

RECTANGULAR WINDOW

$$w_R(n) = 1 \quad ; \quad \text{for } n = -\frac{N-1}{2} \text{ to } +\frac{N-1}{2}$$

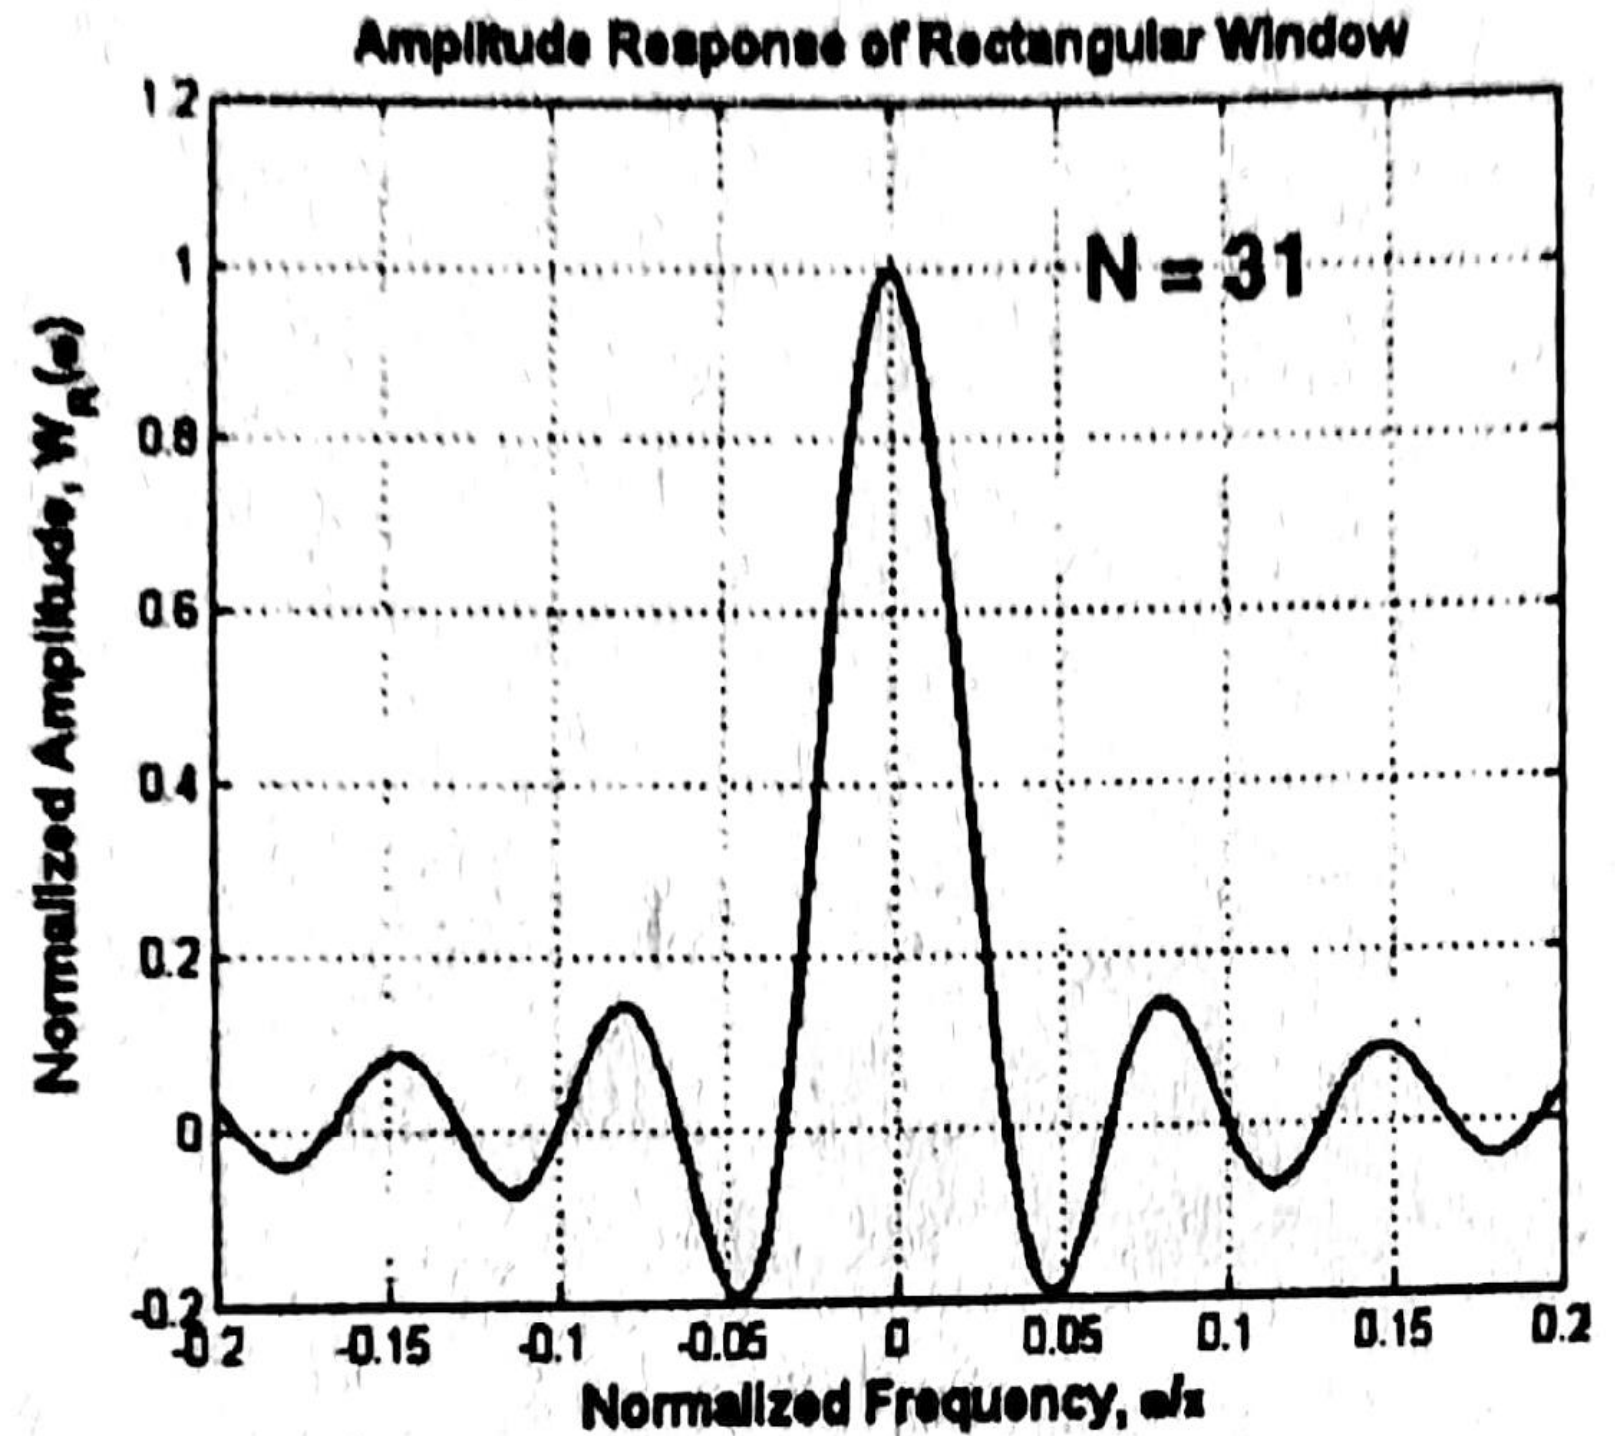

$$= 0 \quad ; \quad \text{other } n$$

$$w_R(n) = 1 \quad ; \quad \text{for } n = 0 \text{ to } N-1$$

$$= 0 \quad ; \quad \text{other } n$$

RECTANGULAR WINDOW

RECTANGULAR WINDOW

Magnitude Response of Rectangular Window

Log-Magnitude Response of Rectangular Window

RECTANGULAR WINDOW

Magnitude Response of Lowpass FIR Filter using $w_R(n)$

Log-Magnitude Response of Lowpass FIR Filter using $w_R(n)$

HANNING WINDOW

Characteristics of FIR Filters designed using Windows:

1. The width of the transition band depends on the type of window
2. The width of the transition band can be made narrow by increasing the value of N,
Where N is the length of the window sequence
3. The attenuation in the stop band is fixed

Features of Hanning Window spectrum:

1. The main-lobe width is equal to $8\pi / N$
2. The maximum side-lobe magnitude is -31dB
3. The side-lobe magnitude decreases with increasing ω

HANNING WINDOW

$$w_C(n) = 0.5 + 0.5 \cos \frac{2\pi n}{N-1} \quad ; \quad \text{for } n = -\frac{N-1}{2} \text{ to } +\frac{N-1}{2}$$
$$= 0 \quad ; \quad \text{other } n$$

$$w_C(n) = 0.5 - 0.5 \cos \frac{2\pi n}{N-1} \quad ; \quad \text{for } n = 0 \text{ to } N-1$$
$$= 0 \quad ; \quad \text{other } n$$

HANNING WINDOW

Hanning Window Sequence

Amplitude Response of Hanning Window

Magnitude Response of Hanning Window

Log-Magnitude Response of Hanning Window

HANNING WINDOW

Magnitude Response of Lowpass FIR Filter using $w_c(n)$

Log-Magnitude Response of Lowpass FIR Filter using $w_c(n)$

IDEAL FREQUENCY RESPONSE FOR FIR FILTER DESIGN USING WINDOWS

Low Pass

$$H_d(e^{j\omega}) = \begin{cases} e^{-j\omega\alpha} & ; \quad -\omega_c \leq \omega \leq +\omega_c \\ 0 & ; \quad -\pi \leq \omega < -\omega_c \\ 0 & ; \quad \omega_c < \omega \leq \pi \end{cases}$$

High Pass

$$H_d(e^{j\omega}) = \begin{cases} e^{-j\omega\alpha} & ; \quad -\pi \leq \omega \leq -\omega_c \\ e^{-j\omega\alpha} & ; \quad \omega_c \leq \omega \leq \pi \\ 0 & ; \quad -\omega_c < \omega < +\omega_c \end{cases}$$

IDEAL FREQUENCY RESPONSE FOR FIR FILTER DESIGN USING WINDOWS

Band Pass

$$H_d(e^{j\omega}) = \begin{cases} e^{-j\omega\alpha} & ; & -\omega_{c2} \leq \omega \leq -\omega_{c1} \\ e^{-j\omega\alpha} & ; & \omega_{c1} \leq \omega \leq \omega_{c2} \\ 0 & ; & -\pi \leq \omega < -\omega_{c2} \\ 0 & ; & -\omega_{c1} < \omega < +\omega_{c1} \\ 0 & ; & \omega_{c2} < \omega \leq \pi \end{cases}$$

Band stop

$$H_d(e^{j\omega}) = \begin{cases} e^{-j\omega\alpha} & ; & -\pi \leq \omega \leq -\omega_{c2} \\ e^{-j\omega\alpha} & ; & -\omega_{c1} \leq \omega \leq +\omega_{c1} \\ e^{-j\omega\alpha} & ; & \omega_{c2} \leq \omega \leq \pi \\ 0 & ; & -\omega_{c2} < \omega < -\omega_{c1} \\ 0 & ; & \omega_{c1} < \omega < \omega_{c2} \end{cases}$$

DESIRED IMPULSE RESPONSE FOR FIR FILTER DESIGN USING WINDOWS

Low Pass

$$h_d(n) = \frac{1}{2\pi} \int_{-\pi}^{\pi} H_d(e^{j\omega}) e^{j\omega n} d\omega = \frac{1}{2\pi} \int_{-\omega_c}^{\omega_c} e^{-j\omega\alpha} e^{j\omega n} d\omega$$

$$\left[\because H_d(e^{j\omega}) = 0 \text{ in the range } -\pi \leq \omega < -\omega_c \text{ and } +\omega_c < \omega \leq +\pi \right]$$

High Pass

$$h_d(n) = \frac{1}{2\pi} \int_{-\pi}^{+\pi} H_d(e^{j\omega}) e^{j\omega n} d\omega = \frac{1}{2\pi} \int_{-\pi}^{-\omega_c} e^{-j\omega\alpha} e^{j\omega n} d\omega + \frac{1}{2\pi} \int_{\omega_c}^{\pi} e^{-j\omega\alpha} e^{j\omega n} d\omega$$

$$\left[\because H_d(e^{j\omega}) = 0 \text{ in the range } -\omega_c < \omega < +\omega_c \right]$$

DESIRED IMPULSE RESPONSE FOR FIR FILTER DESIGN USING WINDOWS

Band Pass

$$h_d(n) = \frac{1}{2\pi} \int_{-\pi}^{+\pi} H_d(e^{j\omega}) e^{j\omega n} d\omega = \frac{1}{2\pi} \int_{-\omega_{c2}}^{-\omega_{c1}} e^{-j\omega\alpha} e^{j\omega n} d\omega + \frac{1}{2\pi} \int_{\omega_{c1}}^{\omega_{c2}} e^{-j\omega\alpha} e^{j\omega n} d\omega$$

$$\left[\because H_d(e^{j\omega}) = 0 \text{ in the range } -\pi \leq \omega < -\omega_{c2} ; -\omega_{c1} < \omega < +\omega_{c1} \text{ and } +\omega_{c2} < \omega \leq +\pi \right]$$

Band Stop

$$h_d(n) = \frac{1}{2\pi} \int_{-\pi}^{+\pi} H_d(e^{j\omega}) e^{j\omega n} d\omega = \frac{1}{2\pi} \int_{-\pi}^{-\omega_{c2}} e^{j\omega\alpha} e^{j\omega n} d\omega + \frac{1}{2\pi} \int_{-\omega_{c1}}^{+\omega_{c1}} e^{-j\omega\alpha} e^{j\omega n} d\omega + \frac{1}{2\pi} \int_{\omega_{c2}}^{\pi} e^{-j\omega\alpha} e^{j\omega n} d\omega$$

$$\left[\because H_d(e^{j\omega}) = 0 \text{ in the range } -\omega_{c2} < \omega < -\omega_{c1} \text{ and } +\omega_{c1} < \omega < +\omega_{c2} \right]$$

FIR FILTER DESIGN USING WINDOWS

Symmetry Condition $h(N-1-n) = h(n)$

1. The specifications of digital FIR filter are,

(i) The desired frequency response $H_d(e^{j\omega}) = C e^{-j\alpha\omega}$

Where $C = \text{Constant}$ and $\alpha = N-1/2$

(i) The cutoff frequency ω_c for lowpass and high pass ω_{c1} and ω_{c2} for bandpass and bandstop filters.

(ii) The number of samples of impulse response N

2. Determine the desired impulse response $h_d(n)$ by taking inverse Fourier transform of the desired frequency response $H_d(e^{j\omega})$

$$h_d(n) = \frac{1}{2\pi} \int_{-\pi}^{\pi} H_d(e^{j\omega}) e^{j\omega n} d\omega$$

FIR FILTER DESIGN USING WINDOWS

- Choose the desired window sequence $w(n)$ defined for $n= 0$ to $N-1$. Multiply $h_d(n)$ with $w(n)$ to get the impulse response $h(n)$ of the filter. Calculate N -samples of the impulse response for $n=0$ to $N-1$

Impulse Response

$$h(n) = h_d(n) \times w(n) \text{ for } n=0 \text{ to } N-1$$

- The impulse response is symmetric with centre of symmetry at $(N-1)/2$ and so $h(N-1-n) = h(n)$. It is sufficient if we calculate $h(n)$ for $n=0$ to $(N-1)/2$
- Take Z transform of the impulse response $h(n)$ to get the transfer function $H(z)$ of

FIR Filter

$$H(z) = \mathcal{Z}\{h(n)\} = \sum_{n=0}^{N-1} h(n) z^{-n}$$

- Draw a suitable structure for realization of FIR filter.

FIR FILTER DESIGN USING WINDOWS

Symmetry Condition $h(-n) = h(n)$

1. The specifications of digital FIR filter are,

(i) The desired frequency response $H_d(e^{j\omega}) = C$

Where $C = \text{Constant}$ ($C=1=\text{Normalized Magnitude}$)

(i) The cutoff frequency ω_c for lowpass and high pass ω_{c1} and ω_{c2} for bandpass and bandstop filters.

(ii) The number of samples of impulse response N

2. Determine the desired impulse response $h_d(n)$ by taking inverse Fourier transform of the desired frequency response $H_d(e^{j\omega})$

$$h_d(n) = \frac{1}{2\pi} \int_{-\pi}^{\pi} H_d(e^{j\omega}) e^{j\omega n} d\omega$$

FIR FILTER DESIGN USING WINDOWS

3. Choose the desired window sequence $w(n)$ defined for $n = -\frac{(N-1)}{2}$ to $\frac{(N-1)}{2}$. Multiply $h_d(n)$ with $w(n)$ to get the impulse response $h(n)$ of the filter. Calculate N -samples of the impulse response for $n = -\frac{(N-1)}{2}$ to $\frac{(N-1)}{2}$

Impulse Response

$$h(n) = h_d(n) \times w(n) \text{ for } n = -\frac{(N-1)}{2} \text{ to } \frac{(N-1)}{2}$$

- The impulse response is symmetric with centre of symmetry at $n=0$ and so $h(-n) = h(n)$. It is sufficient if we calculate $h(n)$ for $n=0$ to $\frac{(N-1)}{2}$
4. Take Z transform of the impulse response $h(n)$ to get the transfer function $H(z)$ of FIR Filter, $H_N(z)$

$$H_N(z) = \mathcal{Z}\{h(n)\} = \sum_{n = -\frac{N-1}{2}}^{+\frac{N-1}{2}} h(n) z^{-n}$$

PROCEDURE FOR DIGITAL FIR FILTER BY FOURIER SERIES METHOD

5. Convert the noncausal transfer function, $H_N(z)$ to causal transfer function, $H(z)$ by multiplying $H_N(z) Z^{-(N-1)/2}$

$$H(z) = z^{-\frac{N-1}{2}} \sum_{n = -\frac{N-1}{2}}^{+\frac{N-1}{2}} h(n) z^{-n}$$

Transfer Function

$$H(z) = z^{-\frac{N-1}{2}} \left[h(0) + \sum_{n=1}^{\frac{N-1}{2}} h(n) \left[z^n + z^{-n} \right] \right]$$

6. Draw a suitable structure for realization of FIR filter

COMPARISON OF RECTANGULAR & HANNING WINDOW

S.No.	Rectangular Window	Hanning Window
1	The width of the main-lobe in window spectrum is $4\pi/N$	The width of the main-lobe in window spectrum is $8\pi/N$
2	The maximum side-lobe magnitude in window spectrum is -13dB	The maximum side-lobe magnitude in window spectrum is -31dB
3	In window spectrum the side-lobe magnitude slightly decreases with increasing ω	In window spectrum the side-lobe magnitude decreases with increasing ω
4	In FIR filter designed using rectangular window, the minimum stopband attenuation is 22dB	In FIR filter designed using hanning window, the minimum stopband attenuation is 44dB

ASSESSMENT

1. Define IIR Filters.
2. The windows are finite duration sequences used to modify the impulse response of the FIR filters in order to reduce -----
3. List the types of windowing techniques.
4. Compare rectangular window and hanning window.
5. How to calculate desired impulse response $h_d(n)$
6. Discuss the Ideal frequency response for FIR filters using windows.

THANK YOU
